introduces aqueous geochemistry applied to geothermal systems It is specifically designed for readers first entering into the world of geothermal energy from a variety of scientific and engineering backgrounds and consequently is not intended to be the last word on geothermal chemistry Instead it is intended to provide readers with sufficient background knowledge to permit them to subsequently understand more complex texts and scientific papers on geothermal energy The book is structured into two parts The first explains how geothermal fluids and their associated chemistry evolve and shows how the chemistry of these fluids can be used to deduce information about the resource The second part concentrates on survey techniques explaining how these should be performed and the procedures which need to be adopted to ensure reliable sampling and analytical data are obtained A geothermal system requires a heat source and a fluid which transfers the heat towards the surface The fluid could be molten rock magma or water This book concentrates on the chemistry of the water or hydrothermal systems Consequently magma energy systems are not considered Hot dry rock HDR systems are similarly outside the scope of this text principally because they contain no indigenous fluid for study Both magma energy and HDR systems have potential as energy sources but await technological developments before they can be exploited commercially Geothermal systems based on water however are proven energy resources which have been successfully developed throughout the world Monthly Catalogue, United States Public Documents ,1995
