essential to compress fractures interfragmentarily in order to make them resistant to the tensile force of muscles and the  
force resulting from acceleration and deceleration This can be best achieved by the use of cable tension bands as a traction  
mechanism The cable tension band is in terms of stability of fractures far superior to the conventional rigid cerclage wire  
which has been widely used in osteosynthesis for over 100 years The author explains the biomechanics of the tension band in  
detail Theoretical findings are confirmed by clinical test results All osteosynthetic techniques which can be carried out with  
cables are described giving details of operation instructions Errors and risks are always pointed out A reference book and
