Manual of Clinical Problems in Internal Medicine Jerry L. Spivak, Herman Verdain Barnes, 1974      *Flight mechanics and flight control for a multibody aircraft* Köthe, Alexander, 2019-06-26 Aircraft operating as so called High Altitude Platform Systems HAPS have been considered as a complementary technology to satellites since several years These aircraft can be used for similar communication and monitoring tasks while operating at a fraction of the cost Such concepts have been successfully tested Those include the AeroVironment Helios and the Airbus Zephyr with an endurance of nearly 624 hours 26 days All these HAPS aircraft have a high aspect ratio wing using lightweight construction In gusty atmosphere this results in high bending moments and high structural loads which can lead to overloads Aircraft crashes for example from Google s Solara 50 or Facebook s Aquila give proof of that fact Especially in the troposphere where the active weather takes place gust loads occur which can lead to the destruction of the structure The Airbus Zephyr the only HAPS aircraft without flight accidents provides only a very small payload Thus it does not fully comply with the requirements for future HAPS aircraft To overcome the shortcomings of such single wing aircraft so called multibody aircraft are considered to be an alternative The concept assumes multiple aircraft connected to each other at their wingtips It goes back to the German engineer Dr Vogt In the United States shortly after the end of World War II he experimented with the coupling of manned aircraft This resulted in a high aspect ratio wing for the aircraft formation The range of the formation could be increased correspondingly The engineer Geoffrey S Sommer took up Vogt s idea and patented an aircraft configuration consisting of several unmanned aerial vehicles coupled at their wingtips However the patent does not provide any insight into the flight performance the flight mechanical modeling or the control of such an aircraft Single publications exist that deal with the performance of coupled aircraft A profound complete analysis however is missing so far This is where the present work starts For the first time a flying vehicle based on the concept of the multibody aircraft will be analyzed in terms of flight mechanics and flight control In a performance analysis the aircraft concept is analyzed in detail and the benefits in terms of bending moments and flight performance are clearly highlighted Limits for operation in flight are shown considering aerodynamic optimal points The joints at the wingtips allow a roll and pitch motion of the individual aircraft This results in additional degrees of freedom for the design through the implementation of different relative pitch and bank angles For example using individual pitch angles for individual aircraft further decreases the induced drag and increases flight performance Because the lift is distributed symmetrically but not homogenously along the wingspan a lateral trim of the individual aircraft in formation flight becomes necessary The thesis presents a new method to implement this trim by moving the battery mass along half the wingspan which avoids additional parasite drag Further a complete flight dynamics model is provided and analyzed for aircraft that are mechanically connected at their wingtips To study this model in detail a hypothetical torsional and bending spring between the aircraft is introduced If the spring constants are very high the flight dynamics model has properties

similar to those of an elastic aircraft Rigid body and formation eigenmotions can be clearly distinguished If the spring constants are reduced towards zero which represents the case of the multibody aircraft classical flight mechanics eigenmotions and modes resulting from the additional degrees of freedom are coupled This affects the eigenstructure of the aircraft Hence normal motions with respect to the inertial space as known from a rigid aircraft cannot be observed anymore The plant also reveals unstable behavior Using the non linear flight dynamics model flight controllers are designed to stabilize the plant and provide the aircraft with an eigenstructure similar to conventional aircraft Different controller design methods are used The flight controller shall further maintain a determined shape of the flight formation it shall control flight bank and pitch angles and it shall suppress disturbances Flight control theories in the time domain Eigenstructure assignment and in the frequency domain H infinity loop shaping are considered The resulting inner control loops yield a multibody aircraft behavior that is similar to the one of a rigid aircraft For the outer control loops classical autopilot concepts are applied Overall the flight trajectory of the multibody aircraft above ground is controlled and thus an actual operation as HAPS is possible In the last step the flight controller is successfully validated in non linear simulations with complete flight dynamics Flugzeuge in der Form von sogenannten H henplattformen engl High Altitude Platform Systems HAPS werden seit einigen Jahren als kosteng nstige Erg nzung zu teuren Satelliten betrachtet Diese Flugzeuge k nnen f r hnliche Kommunikations und bewachungsaufgaben eingesetzt werden Zu den gegenw rtigen Konzepten solcher Flugger te die bereits erfolgreich im Flugversuch eingesetzt wurden z hlen der Helios von AeroVironment und der Airbus Zephyr der eine Flugdauer von fast 624 Stunden 26 Tagen erreicht hat Alle diese HAPS Flugzeuge besitzen einen Fl gel langer Streckung der in Leichtbauweise konstruiert ist Hieraus resultieren in b iger Atmosph re hohe Biegemomente und starke strukturelle Belastungen die zu berbelastungen f hren k nnen Flugunf lle beispielsweise von Googles Solara 50 oder Facebooks Aquila belegen dies Insbesondere in der Troposph re in der das aktive Wetter stattfindet treten B enlasten auf die die Struktur zerst ren k nnen Der Airbus Zephyr der bisher als einziges HAPS Flugzeug frei von Flugunf llen ist besitzt nur eine sehr geringe Nutzlast Daher kann er die Anforderungen an zuk nftige HAPS Flugzeuge nicht vollst ndig erf llen Um die Schwachstellen solcher Ein Fl gel Konzepte zu berwinden wird in dieser Arbeit ein alternatives Flugzeugkonzept betrachtet das als Mehrkr rperflugzeug bezeichnet wird Das Konzept geht von mehreren an den Fl gelspitzen miteinander verbundenen Flugzeugen aus und beruht auf Ideen des deutschen Ingenieurs Dr Vogt Dieser hatte in den USA kurz nach Ende des Zweiten Weltkrieges bemannte Flugzeuge aneinanderkoppeln lassen Hierdurch ergab sich ein Flugzeugverbund mit einem Fl gel langer Streckung Damit konnte die Reichweite des Verbundes gesteigert werden Geoffrey S Sommer griff die Idee von Vogt auf und lies sich eine Flugzeugkonfiguration patentieren die aus mehreren unbemannten Flugzeugen besteht die an den Enden der Tragfl chen miteinander gekoppelt sind Die Patentschrift gibt jedoch keinen Einblick in die Flugeleistungen die flugmechanische Modellierung oder die Regelung eines solchen Flugger tes Vereinzelt existieren Ver ffentlichungen die sich

mit den Flugleistungen von gekoppelten Luftfahrzeugen besch ftigen Eine tiefgreifende vollst ndige flugmechanische Analyse fehlt jedoch bisher Hier setzt die vorliegende Arbeit an Ein Flugger t basierend auf dem Konzept des Mehrkr rperflug zeugs wird erstmalig hinsichtlich der Flugmechanik und Flugregelung untersucht In einer Flugleistungsbetrachtung wird das Flugzeugkonzept genau analysiert und die Vorteile hinsichtlich der Biegemomente und der Flugleistungen klar herausgestellt Die Grenzen des Einsatzes im Flugbetrieb werden mithilfe aerodynamischer Optimalpunkte aufgezeigt ber die Lager an den Fl gelspitzen die eine relative Roll und Nickbewegung der Flugzeuge untereinander erm glichen ergeben sich durch die Einstellung unterschiedlicher L ngslage und H ngewinkel zus tzliche Freiheitsgerade im Entwurf Die Verwendung unterschiedlicher Nicklagewinkel der einzelnen Flugzeuge reduziert beispielsweise den induzierten Widerstand weiter und steigert die Flugleistung Durch die symmetrische entlang der Spannweite jedoch nicht homogene Auftriebsverteilung ist auch eine laterale Trimmung der einzelnen Flugzeuge in der Formation notwendig Hier stellt die Arbeit eine neuartige M glichkeit vor um diese Trimmung ohne zus tzlichen parasit ren Widerstand mittels Verschiebung der Batteriemasse entlang der Halbspannweite umzusetzen Weiterhin wird ein vollst ndiges flugdynamisches Modell f r ber mechanische Lager verbundene Luftfahrzeuge aufgestellt und analysiert F r diese Analyse wird eine hypothetische Torsions und Biegefeder zwischen den Flugzeugen modelliert Sind die Federsteifigkeiten hinreichend hoch besitzt das flugdynamische Modell Eigenschaften die einem elastischen Flugzeug entsprechen Starrkr rper und elastische Eigenbewegungsformen sind in diesem Fall klar separiert Bei immer weiterer Reduzierung bis auf eine Federsteifigkeit von Null kommt es zu Kopplungen zwischen den klassischen flugmechanischen Eigenbewegungsformen und den Moden aus den zus tzlichen Freiheitsgraden Dies stellt den Auslegungsfall f r das Mehrkr rperflugzeug dar Hierbei ver ndert sich die Eigenstruktur engl eigenstructure des Flugzeugs und normale bei einem starren Flugzeug beobachtbare Bewegungen gegen ber dem inertialen Raum sind nicht mehr erkennbar Zus tzlich zeigt die Strecke instabiles Verhalten Basierend auf dem nichtlinearen flugdynamischen Modell werden mit verschiedenen Methoden Regler entworfen die die Regelstrecke stabilisieren und dem Flugzeug eine Streckenstruktur zuweisen die derjenigen klassischer Flugzeuge hnelt Zudem soll durch die Regler eine vorgegebene Form des Flugzeugverbundes beibehalten werden die Fahrt der L ngs und Rolllagewinkel sollen geregelt und St rungen unterdr ckt werden Als Auslegungsverfahren werden Theorien der Zustandsregelungen im Zeitbereich Eigenstrukturvorgabe und Frequenzbereich H infinity loop shaping verwendet Hierdurch wird durch die inneren Regelschleifen ein Verhalten des Mehrkr rperflugzeugs erzielt das dem eines starren Flugzeugs entspricht F r die u eren Regelschleifen werden anschlie end klassische Konzepte von Autopiloten verwendet Im Ergebnis ist eine Regelung des Flugweges ber Grund des Mehrkr rperflugzeugs und somit ein tats chlicher Betrieb als HAPS m glich Die Funktionalit t des Reglers wird abschlie end in nichtlinearen Simulationen mit vollst ndiger Flugdynamik verifiziert Human Movement and Motor Control in the Natural Environment Peter A Federolf, Maurice Mohr, Thorsten Stein, Gert-Jan Pepping, Steven van Andel, Gillian Weir, 2023-06-08 The

basic understanding of human movement and control of human movement stems largely from laboratory measurements where human movement can be quantified with high precision and accuracy but where the artificial environment compromises ecological validity A good example for this issue was demonstrated in a recent investigation specifically that the walking gait pattern of healthy individuals in a laboratory changed as a function of how many researchers were present during the experiment Observations like these underscore that study volunteers adapt their behavior to the specific laboratory environment and warrant the question of how well we can transfer our lab based understanding of gait patterns and the underlying neuromuscular control system to walking during daily living Another research area where lab based movement assessments have led to conflicting findings is the field of sports injury prevention Many neuromuscular training programs have been shown to be effective in reducing the sport injury rate in athletes by 30 50% or more in a variety of different multi directional sports Nevertheless lab based assessments of the same athletes who completed those training programs were often not able to detect improvements in motor control of sport specific movements or a reduction in joint loading two factors thought to be closely linked with sport injury risk This disconnect suggests that lab based assessments of movement and motor control are often poor indicators of player behavior during real game scenarios and may limit our ability to screen athletes for injury risk or monitor their progress in rehabilitation These examples highlight that we should strive for the assessment and investigation of human movement and motor control in natural environments i e where individuals patients athletes or other groups of interest perform explore and interact under real world conditions

**Redundancy in Robot Manipulators and Multi-Robot Systems** Dejan Milutinović,Jacob Rosen,2012-10-12 The trend in the evolution of robotic systems is that the number of degrees of freedom increases This is visible both in robot manipulator design and in the shift of focus from single to multi robot systems Following the principles of evolution in nature one may infer that adding degrees of freedom to robot systems design is beneficial However since nature did not select snake

like bodies for all creatures it is reasonable to expect the presence of a certain selection pressure on the number of degrees of freedom Thus understanding costs and benefits of multiple degrees of freedom especially those that create redundancy is a fundamental problem in the field of robotics This volume is mostly based on the works presented at the workshop on Redundancy in Robot Manipulators and Multi Robot Systems at the IEEE RSJ International Conference on Intelligent Robots and Systems IROS 2011 The workshop was envisioned as a dialog between researchers from two separate but obviously related fields of robotics one that deals with systems having multiple degrees of freedom including redundant robot manipulators and the other that deals with multirobot systems The volume consists of twelve chapters each representing one of the two fields
