Sectors Dannele E. Peck, Jeffrey M. Peterson, 2016-02-22 Demand for water in agricultural municipal industrial and environmental uses is growing More frequent and severe extreme weather conditions now exacerbate water shortages in many locations and existing infrastructure to store and release water rarely has the capacity to both prevent floods during wet periods and meet demand during drought periods Competition among sectors adds pressure not only on water infrastructure but also on management policies and allocation institutions This book of contributed chapters assesses the performance of existing infrastructure institutions and policies under different climate variability scenarios It also provides

suggestions for minimizing conflict over scarce water resources More flexible water allocation institutions and management policies and better tools for decision making under uncertainty will be required to maximize society's net benefit from less reliable water resources The chapters show how incentives for individuals to conserve water and policies for helping vulnerable populations prepare for and recover from extreme events will also need to be improved This book was originally published as a special issue of the Journal of Natural Resources Policy Research

Rooftop Urban Agriculture Francesco Orsini, Marielle Dubbeling, Henk de Zeeuw, Giorgio Gianquinto, 2017-11-16 This book guides architects landscape designers urban planners agronomists and society on the implementation of sustainable rooftop farming projects The interdisciplinary team of authors involved stresses the different approaches and the multi faceted forms that rooftop farming may assume in any context While rooftop farming experiences are sprouting all over the world the need for scientific evidence on the most suitable growing solutions policies and potential benefits emerges This volume brings together existing experiences as well as suggestions for planning future sustainable cities

Integrating Multiscale Observations of U.S. Waters National Research Council, Division on Earth and Life Studies, Water Science and Technology Board, Committee on Integrated Observations for Hydrologic and Related Sciences, 2008-05-16 Water is essential to life for humans and their food crops and for ecosystems Effective water management requires tracking the inflow outflow quantity and quality of ground water and surface water much like balancing a bank account Currently networks of ground based instruments measure these in individual locations while airborne and satellite sensors measure them over larger areas Recent technological innovations offer unprecedented possibilities to integrate space air and land observations to advance water science and guide management decisions This book concludes that in order to realize the potential of integrated data agencies universities and the private sector must work together to develop new kinds of sensors test them in field studies and help users to apply this information to real problems

Remote Sensing for Agriculture, Ecosystems, and Hydrology, 2004 **The Earth's Hydrological Cycle** L. Bengtsson, R.-M. Bonnet, M. Calisto, G. Destouni, R. Gurney, J. Johannessen, Y. Kerr, W.A. Lahoz, M. Rast, 2014-05-02 This book gives a comprehensive presentation of our present understanding of the Earth's Hydrological cycle and the problems consequences and impacts that go with this topic Water is a central component in the Earth's system It is indispensable for life on Earth in its present form and influences virtually every aspect of our planet's life support system On relatively short time scales atmospheric water vapor interacts with the atmospheric circulation and is crucial in forming the Earth's climate zones Water vapor is the most powerful of the greenhouse gases and serves to enhance the tropospheric temperature The dominant part of available water on Earth resides in the oceans Parts are locked up in the land ice on Greenland and Antarctica and a smaller part is estimated to exist as groundwater If all the ice over the land and all the glaciers were to melt the sea level would rise by some 80 m In comparison the total amount of water vapor in the atmosphere is small it amounts to

25 kg m² or the equivalent of 25 mm water for each column of air Yet atmospheric water vapor is crucial for the Earth's energy balance The book gives an up to date presentation of the present knowledge Previously published in Surveys in Geophysics Volume 35 No 3 2014 **Hydrology Days** ,1999
