

Sine, Cosine, and Tangent: The Right-Angle Trig Functions

Remember similar triangles from Geometry?

if I tell you both a and b , and give you a protractor, you should be able to find α (or β) in the triangle to the left. And you'd get the same answer if I gave you a' and b' in the triangle to the right.

The fact that there is a method of going from knowing the lengths of the sides of a right triangle to knowing the angles of those triangles (by using your protractor) means that there is a **relation** between the sides and angles of a triangle. This just means that given the **input** lengths a and b , we can find a unique **output** angle α . Here are examples of this relation:

$$\begin{aligned}(a, b) &\rightarrow \alpha \\ (1, 1) &\rightarrow 45^\circ \\ (a', b') &\rightarrow \alpha\end{aligned}$$

Since for every input we have a unique output, the relation from the lengths to the sides is a **function** (this is all a function means). But what if we wanted to go from the angles to the sides? If we reverse the arrows in the above example, we run into a problem:

$$\begin{aligned}\alpha &\rightarrow (a, b) \\ 45^\circ &\rightarrow (1, 1) \\ \alpha &\rightarrow (a', b')\end{aligned}$$
