Fire Operation Inspection and Notification to Fire Dept

1. Check the electrical wiring connecting the output units of the system to electrical storage.
2. Check the air line break switches and weights for free movement.

4. Discussion

The following tests shall be performed with care to prevent damage to the machine or injury to personnel. Proper functioning of the system requires successful completion of these tests before operating the machine.

If the operator cannot use the load-handling function approaching the boom area, he/she has an escape route (e.g. jump) until the load-handling device. The operator will be progressively along the machine chassis area, where they will not interfere with the load-handling property. If the LMF (or equivalent A system) is not functioning properly, lifting the anti-two-block weight will not activate the red warning light in the subtle alarm (indicator for the ACR system), and will not lock the crane movement (e.g. interlocks out, and block down).

- Check the following items before starting light and audible alarm by confirming one of the following items.
 - Intensity of the weight attached to the unit must be sufficient. (When the weight is 100kg, the audible alarm for the LHM or optional audible alarm for the optional MCA system should sound and the prism-head alarm light should light.)
 - Verify noise for each alarm. Load handling device to create a potential two-point condition. When the load handling device lifts the weight, the audible alarm should sound, the two-point alarm light should light and the motion of the load handling device should be stopped. (When the load handling device begins to move, lower the condition.)
 - Verify external interlocks. The device to create a potential two-point condition. When the load handling device lifts the weight, the audible alarm should sound, the two-point alarm light should light and the device interlocks and functions should be stopped. (When the load handling device starts to move, lower the condition.)

CAUTION

If the light and siren alarm do not function as described and the crane movements are not stopped, the system is not working properly. The notification shall be corrected before operating the crane.

4. If the crane is equipped with a boom extension that is telescopic and capable to swing, repeat the test procedure for the boom extension and for each swing position.
