Ibbott,2018-05-29 This book vol 1 presents the proceedings of the IUPESM World Congress on Biomedical Engineering and Medical Physics a triennially organized joint meeting of medical

physicists biomedical engineers and adjoining health care professionals Besides the purely scientific and technological topics the 2018 Congress will also focus on other aspects of professional involvement in health care such as education and training accreditation and certification health technology assessment and patient safety The IUPESM meeting is an important forum for medical physicists and biomedical engineers in medicine and healthcare learn and share knowledge and discuss the latest research outcomes and technological advancements as well as new ideas in both medical physics and biomedical engineering field div Chapter Evaluation of the Impact of an International Master of Advanced Studies in Medical Physics is available open access under a Creative Commons Attribution 3.0 IGO Licence via link springer.com Contemporary Ergonomics 2007 Philip D. Bust, 2018-02-06 Presenting the Proceedings of the Ergonomics Society's annual conference the series embraces the wide range of topics covered by ergonomics Individual papers provide insight into current practice present new research findings and form an invaluable reference source A wide range of topics are covered in these proceedings including Ergonomics Human Factors and User Centred Design It also features related disciplines such as Psychology Engineering and Physiology Particular emphasis is given to the utility of these disciplines in improving health safety efficiency and productivity The 2007 Annual Conference features Human factors at the heart of systems engineering As well as being of interest to mainstream ergonomists and human factors specialists Contemporary Ergonomics will appeal to all those who are concerned with the interaction of people with their working and leisure environment including designers manufacturing and production engineers health and safety specialists occupational applied and industrial psychologists and applied physiologists *The right ventricle in volume or pressure overload* Aleksandra Trzebiatowska-Krzynska, 2019-01-07 This study is inspired by the gap in knowledge regarding the timing of cardiac surgery and interventions in adult patients with congenital heart disease There are many parameters used assessing right ventricular function however most of them have pitfalls Understanding the pathomechanisms by which the heart adapts to congenital defects is probably key to find the answer when it is time to intervene and start discussing treatment options Heart defects are the most frequently occurring congenital disorders Less than 50% of individuals with moderate to severe congenital heart defects e.g. transposition of the great arteries TGA or tetralogy of Fallot TOF survive to adulthood without intervention Advances in cardiac surgery and better identification of individuals at risk for sudden cardiac death have increased survival rates Currently more than 96% of patients with congenital heart disease survive to at least 16 years of age most undergo corrective surgery but are not cured and only a few have normal physiology and anatomy In many cases the heart must develop mechanisms of adaptation to the changed conditions after surgery Consequently correction of the defect creates residual disease with a risk of future complications To prevent clinical deterioration and to identify the development of complications patients need lifelong regular follow up The choice of followup modalities depends on the cardiac malformation The right ventricle RV plays an important role as it is often part of the defect or is influenced by the surgery In the past research was focused on assessment

of left ventricular function LV and the RV was the forgotten ventricle Observations and studies in the last few decades brought increased interest into the RV and revealed the importance of the RV in the prognosis of various cardiac diseases An understanding of RV morphology pathophysiology and adaptive mechanisms is crucial for further studies of prognosis as well as for research linked to the use of particular diagnostic modalities When the RV is exposed to increased pressure load e g in atrially corrected transposition of the great arteries TGA adaptation affects the cavity volume as well as the wall thickness When the RV is volume overloaded adaptation involves enhancement of the RV cavity volume while the wall thickness often remains unchanged under long time RV ejection fraction RVEF gives some information about changes in RV function but information on myocardial contractility and contractile reserve is also needed New functional parameters such as strain also known as myocardial deformation provide some information about intrinsic myocardial function In Paper I we studied functional parameters such as ejection fraction and strain radial and longitudinal strain for both ventricles in patients with Tetralogy of Fallot TOF and TGA Longitudinal RV strain was depressed in both patient groups in comparison with that in healthy individuals and there were additional differences between the two patient groups In Paper II we validated three dimensional echocardiography 3DEcho against the cardiac magnetic resonance CMR gold standard The study population was limited to patients with TOF In general 3DEcho underestimated RV volumes but was able to identify patients with RV dilatation on CMR with high sensitivity RV longitudinal free wall strain measured by CMR with a cut off set at 14% identified patients with depressed exercise capacity and low peak oxygen uptake In Paper III we studied a new CMR method to quantify and visualise turbulent flow in the heart and vessels Turbulent flow can be harmful to tissue blood cells and endothelium and can contribute to tissue remodeling In patients with TOF turbulent flow can be seen as variance in 2DEcho color Doppler In CMR increased turbulent kinetic energy TKE could be seen with four dimensional flow The RV TKE was increased in patients with TOF with pulmonary regurgitation compared with that in healthy controls In Paper IV we validated knowledge based reconstruction KBR a novel method to calculate RV volume against CMR in patients with various types of congenital heart defects Two dimensional echocardiogram based three dimensional RV reconstruction is a relatively uncomplicated method that creates a three dimensional RV model based on a limited number of predefined points of interest RV structures such as tricuspid annulus RV free wall or pulmonary valve KBR showed good agreement with CMR intraclass correlation coefficient 0.84 for RV end diastolic volume and 0.89 for ejection fraction but tended to underestimate RV volumes which is in line with other methods based on ultrasound Conclusions 3DEcho is an evolving modality that is able to identify patients with RV dilatation It can be used clinically for the follow up of patients with congenital heart diseases especially those with mildly to moderately dilated RVs When an intervention seems likely 3DEcho results should be verified by CMR CMR derived measurements of longitudinal and radial strain provide a new understanding of RV remodeling and ventricular interdependence in patients with TOF and TGA Depressed longitudinal strain may indicate a risk of depressed exercise

capacity and in patients with TGA clinical deterioration Further studies in larger populations of patients with congenital heart defects are needed as the altered RV morphology in such patients makes quantitative assessment especially challenging

Mauger, Florentina J. Hettinga, Dominic P. Micklewright, Andrew Renfree, Benjamin Pageaux, Hollie S. Jones, Jo Corbett, 2017-11-22 Successful endurance performance requires the integration of multiple physiological and psychological systems working together to regulate exercise intensity in a way that will reduce time taken or increase work done The systems that ultimately limit performance of the task are hotly contested and may depend on a variety of factors including the type of task the environment external influences training status of the individual and a host of psychological constructs These factors can be studied in isolation or inclusively as a whole body or integrative system A reductionist approach has traditionally been favoured leading to a greater

understanding and emphasis on muscle and cardiovascular physiology but the role of the brain and how this integrates multiple systems is gaining momentum. However, these differing approaches may have led to false dichotomy and now with better understanding of both fields there is a need to bring these perspectives together. The divergent viewpoints of the limitations to human performance may have partly arisen because of the different exercise models studied. These can broadly be defined as open loop where a fixed intensity is maintained until task disengagement or closed loop where a fixed distance is completed in the fastest time which may involve whole body or single limb exercise. Closed loop exercise allows an analysis of how exercise intensity is self regulated i.e. pacing and thus may better reflect the demands of competitive endurance performance. However, whilst this model can monitor changes in pacing this is often at the expense of detecting subtle differences in the measured physiological or psychological variables of interest. Open loop exercise solves this issue but is limited by its more restrictive exercise model. Nonetheless, much can be learnt from both experimental approaches when these constraints are recognised. Indeed, both models appear equally effective in examining changes in performance and so the researcher should select the exercise model which can most appropriately test the study hypothesis. Given that a multitude of both internal e.g. muscle fatigue, perception of effort, dietary intervention, pain etc. and external e.g. opponents, crowd, presence, course topography, extrinsic reward etc. factors likely contribute to exercise regulation and endurance performance, it may be that both models are required to gain a comprehensive understanding. Consequently, this research topic seeks to bring together papers on endurance performance from a variety of paradigms and exercise models with the overarching aim of comparing, examining and integrating their findings to better understand how exercise is regulated and how this may or may not limit performance.

Physical, Physiological and Technical Development in Youth Athletes Roberto Modena, Chiara Zoppirolli, Paolo Riccardo Brustio, 2025-09-16. The long term development of athletes represents a complex puzzle that needs to be solved to allow athletes to get qualifications while allowing them to reach their highest potential level of performance in adulthood. The importance of structured and age appropriate training cannot be underestimated as it lays the foundation for further performance, lifelong healthy habits and a strong work ethic. Structured and age appropriate training allows for the right timing of physical, physiological and technical improvements through the correct development of strength, endurance and skill acquisition, also guaranteeing the consciousness of crucial values such as teamwork, perseverance and goal setting. Coaches and trainers in youth sports must strive to balance pushing young athletes to reach their full potential and ensuring that training remains enjoyable and fosters a love for the sport. Moreover, age appropriate training programs consider the unique physiological and psychological characteristics of young athletes, promoting proper growth and minimising the risk of injuries.
