Industrial applications

can also often be situated in extreme environments such as offshore oil and gas and nuclear industries In such applications the autonomous robot is expected to complete tasks such as repair and maintenance exploration reconnaissance inspection and transportation which is either done in isolation or as a team of cooperative robots Due to the harsh and severe conditions of such environments designing an advanced robotic system that can endure them is a challenging task The robot needs to cope with the time varying restricted uncertain and unstructured nature of the environment to achieve the planning and execution of the tasks This in turn demands development of advanced robust and adaptive motion control and navigation algorithms along with machine learning and deep learning algorithms with high cognitive capability for the robot to perceive the surrounding environment effectively The use of both single and multi robot platforms can be advantageous depending on the specific application and environment
