Nuclear Power Reactors

As of 2000, there are 434 central station nuclear power reactors operating worldwide to produce 350,442 MWe of electrical power. Of this number, 252 are pressurized water reactors (PWRs), 92 are boiling water reactors (BWRs), 34 are gas-cooled reactors (GCRs) of all types, 39 are heavy water-cooled reactors of all types (mostly CANDUs), 15 are graphite-moderated light-water pressure tube reactors (RBMKs), and 2 are liquid-metal fast breeder reactors (LMFBRs). The general physics-related characteristics of such reactors are described in the following sections. To be quantitative, specific reactors that produce 900 to 1300 MWe (650 MWe in the case of CANDUs) were chosen, but it should be noted that reactors of each type can vary greatly in size and power output, so the numbers should be understood to be only representative. In addition to the central station power reactors mentioned above, there are more than 100 pressurized water naval propulsion reactors in the U.S. fleet (plus others in foreign fleets) and numerous research and special purpose reactors of various types worldwide.

Pressurized Water Reactors

Pressurized water reactors (PWRs) were first developed in the United States based on experience from the naval reactor program. The first commercial electric power-producing unit started operation at Shippingport, Pennsylvania in 1957. The PWR is now widely distributed worldwide. The basic structure of the PWR core is the approximately 20 cm \times 20 cm \times 4 m high fuel assembly shown in Fig. 7.1, consisting of an array of zircaloy-clad UO_2 fuel pins, or rods, of about 1 cm diameter. The enrichment varies from about 2 to 4% or more, depending on the burnup objective. A typical fuel assembly may consist of a 17 \times 17 array of fuel pins of about 1 cm diameter. The coolant flows in an open lattice structure which permits some flow mixing and is under sufficient pressure that no boiling occurs under normal operation.

Long-term reactivity control is provided by adjustment of the boric acid content in the coolant. The soluble poison concentration decreases with fuel burnup to compensate fuel reactivity loss and must be reduced to compensate ^{135}Xe and

Power Reactor Technology and Reactor Fuel Processing, 1968 Health Physics Joseph John

Bevelacqua, 2016-07-12 The book bridges the gap between existing health physics textbooks and reference material needed by a practicing health physicist as the 21st century progresses This material necessarily encompasses emerging radiation generating technologies advances in existing technology and applications of existing technology to new areas The book is written for advanced undergraduate and graduate science and engineering courses It is also be a useful reference for scientists and engineers *Computational Methods in Transport* Frank Graziani, 2006-02-17

There exist a wider range of applications where a signi cant fraction of the momentum and energy present in a physical problem is carried by the transport of particles Depending on the specific application the particles involved may be photons neutrons neutrinos or charged particles Regardless of which phenomena is being described at the heart of each application is the fact that a Boltzmann like transport equation has to be solved The complexity and hence expense involved in solving the transport problem can be understood by realizing that the general solution to the 3D Boltzmann transport equation is in fact really seven dimensional 3 spatial coordinates 2 angles 1 time and 1 for speed or energy Low order approximations to the transport equation are frequently used due in part to physical justification but many in cases simply because a solution to the full transport problem is too computationally expensive An example is the diffusion equation which effectively drops the two angles in phase space by assuming that a linear representation in angle is adequate Another approximation is the grey approximation which drops the energy variable by averaging over it If the grey approximation is applied to the diffusion equation the expense of solving what amounts to the simplest possible description of transport is roughly equal to the cost of implicit computational fluid dynamics It is clear therefore that for those application areas needing some form of transport fast accurate and robust transport algorithms can lead to an increase in overall code performance and a decrease in time to solution
