

## Chapter 11: Nuclear Energy Study Guide

### Definitions

- Binding Energy (結合能源)
- Fusion (融合)- Lighter components and atoms combine to form a heavier nuclear
- Fission (裂變)- A heavy atom breaks down into lighter components and atoms.
- $E=mc^2$  this formula states that the equivalent energy (E) can be calculated as the mass (m) multiplied by the speed of light ( $c = 3 \times 10^8$  m/s) squared.

### Study Questions

- What does the binding energy of a nucleus help determine? How does this relate to nuclear fusion and fission?
  - The larger the binding energy, the more stable the nuclear.
  - If new binding energy is available when light nuclei fuse (nuclear fusion), or when heavy nuclei split (nuclear fission), either process can result in the release of this binding energy.
- Energy created through nuclear reactions follows what relationship?
  - It will happen chain reaction. Chain reaction will lead to explosions and it will control rod used to absorb extra neutrons to prevent amplifying reaction.
- Compare the view on nuclear power of the United States in the 1960s, 1980s, and early 21<sup>st</sup> century.
  - Nuclear energy started being used as a resource of electricity in the late 1950s.
  - The demand for nuclear energy in the US started declining after 1975.
  - The numbers of nuclear reactors only have in service in the 21<sup>st</sup> century.
- What is the difference between fusion and fission?
  - Both fission and fusion are nuclear reactions that produce energy, but the **applications** are not the same. Fission is the splitting of a heavy, unstable nucleus into two lighter nuclei, and fusion is the process where two light nuclei combine together releasing vast amounts of energy.
- How do nuclear reactors generate electricity?
  - Nuclear energy originates from the splitting of uranium atoms – a process called fission. This generates heat to produce steam, which is used by a turbine (渦輪) generator to generate electricity. Because nuclear power plants do not burn fuel, they do not produce greenhouse gas emissions.
- What are control rods used for in nuclear reactors?
  - Control rods are used in nuclear reactors to control the fission rate of uranium (鈾) and plutonium (鈷).
- What are the current methods of disposing of spent radioactive fuel rods? Where would the safest location be to store hazardous nuclear material?
  - The short-term solution is using tanks and casks to package the radioactive wastes. The long-term solution is burial the radioactive wastes.
  - The safest location would be the east coast of America to store hazardous nuclear material.
- What features might make nuclear power plants safer?
  - To make nuclear power plants safer, for active safety, we rely on operator-controlled action, external power, electrical signals, etc.
  - For passive safety, engineering devices and structures to prevent reactors from going beyond acceptable ranges of operation.
