Modelling of Nuclear Reactor Multi-physics Christophe Demazière, 2019-11-19 Modelling of Nuclear Reactor Multiphysics From Local Balance Equations to Macroscopic Models in Neutronics and Thermal Hydraulics is an accessible guide to the advanced methods used to model nuclear reactor systems The book addresses the frontier discipline of neutronic thermal hydraulic modelling of nuclear reactor cores presenting the main techniques in a generic manner and for practical reactor calculations The modelling of nuclear reactor systems is one of the most challenging tasks in complex system modelling due to the many different scales and intertwined physical phenomena involved The nuclear industry as well as the research institutes and

universities heavily rely on the use of complex numerical codes. All the commercial codes are based on using different numerical tools for resolving the various physical fields and to some extent the different scales, whereas the latest research platforms attempt to adopt a more integrated approach in resolving multiple scales and fields of physics. The book presents the main algorithms used in such codes for neutronic and thermal hydraulic modelling, providing the details of the underlying methods together with their assumptions and limitations. Because of the rapidly expanding use of coupled calculations for performing safety analyses, the analysts should be equally knowledgeable in all fields, i.e. neutron transport, fluid dynamics, heat transfer. The first chapter introduces the book's subject matter and explains how to use its digital resources and interactive features. The following chapter derives the governing equations for neutron transport, fluid transport and heat transfer so that readers not familiar with any of these fields can comprehend the book without difficulty. The book thereafter examines the peculiarities of nuclear reactor systems and provides an overview of the relevant modelling strategies. Computational methods for neutron transport first at the cell and assembly levels, then at the core level, and for one- and two-phase flow transport and heat transfer are treated in depth in respective chapters. The coupling between neutron transport solvers and thermal hydraulic solvers for coarse mesh macroscopic models is given particular attention in a dedicated chapter. The final chapter summarizes the main techniques presented in the book and their interrelation, then explores beyond state-of-the-art modelling techniques relying on more integrated approaches. Covers neutron transport, fluid dynamics and heat transfer and their interdependence in one reference. Analyses the emerging area of multi-physics and multi-scale reactor modelling. Contains 71 short videos explaining the key concepts and 77 interactive quizzes allowing the readers to test their understanding.

Numerical Methods in Multidimensional Radiative Transfer Guido Kanschat,Erik Meinköhn,Rolf Rannacher,Rainer Wehrse,2008-12-24 Traditionally radiative transfer has been the domain of astrophysicists and climatologists In nuclear technology one has been dealing with the ana gous equations of neutron transport In recent years applications of radiative transferincombustionmachinedesignandinmedicinebecamemoreandmore important In all these disciplines one uses the radiative transfer equation to model the formation of the radiation eld and its propagation For slabs and spheres e fective algorithms for the solution of the transfer equation have been ava able for quite some time In addition the analysis of the equation is quite well developed Unfortunately in many modern applications the approximation of a 1D geometry is no longer adequate and one has to consider the full 3D dependencies This makes the modeling immensely more intricate The main reasons for the di culties result from the fact that not only the dimension of the geometric space has to be increased but one also has to employ two angle variables instead of one and very often one has to consider frequency coupling due to motion or redistribution in spectral lines In actual cal lations this leads to extremely large matrices which in addition are usually badly conditioned and therefore require special care Analytical solutions are not available except for very special cases Although radiative transfer problems are interesting also from a ma ematical point of view mathematicians have largely neglected the transfer equation for a long time
