Bonilla, Antonio Martínez- Amat, Richard Kreider, Francisco Álvarez Salvago, 2025-08-20 The rapid growth of the aging population is related with prevalent age related cognitive impairments usually associated with problems in quality of life and increased cost of healthcare Older adults with neurocognitive disorders have been identified as having a high risk of falling Nonetheless the

relationship of neurocognitive disorders with physical function has been poorly studied Currently there are numerous studies that have analyzed the association between the cognitive status in with physical function in older people In addition relationship said cognitive status with serious problems such as sarcopenia and the risk of falls In this line there are RCTs that are being offered that have demonstrated efficacy on physical and cognitive improvement in older people such as multicomponent exercise programs qigong training and resistance exercise programs *Choice* ,1997 **Winter's**

Arampatzis,Lida Mademli,Kiros Karamanidis,Maria-Elissavet Nikolaidou,2025-06-09 The ability of humans to move effectively and safely through a variety of complex environmental conditions is one of the most critical factors for independent living In this context a coordinated motion of the body limbs in a task specific manner with high temporal and spatial diversity affects

the quality of life over the lifespan Regular exercise triggers important adaptive responses in the neural and musculoskeletal system affecting their function and morphology The activity dependent plasticity of the intrinsic properties within the neural and musculoskeletal systems appear to provide adjustments in movement control and coordination Following injury disease maturation or ageing the interaction between the neural and musculoskeletal systems is often altered and the differential adaptations to disuse ageing treatment or rehabilitation disturb the established task specific movement coordination This results to the development of new and or modified functional coordination patterns based on the altered states and different rates of adaptation of various biological structures and systems A critical component to understand the principles of human movement control and coordination is the integration of knowledge across different organizational levels from neuromuscular circuit to joint and limb mechanics as well as muscle tendon function With this topic we propose to gain beneficial knowledge in movement coordination at the neuromuscular joint limb and muscle tendon levels as well as to enhance our understanding concerning the linkage between them through the integration of various theoretical experimental and or modelling approaches The research topic focuses on studies including original research perspectives reviews and meta analyses commentaries and opinion papers that investigate and discuss 1 Kinematic limb and joint coordination including different methodological techniques e g vector coding discrete and continuous phase analysis principal components covariance uncontrolled manifold approach mechanical energy production and transfer between joints etc 2 Activation patterns and coordination among synergist and antagonist muscles during different human movements e g muscle synchronization and coactivation muscle synergies motor unit recruitment etc 3 Coordination between different muscle tendon units and interplay between activation patterns and contractile mechanisms for force generation and power production e g muscle operating length and velocity decoupling mechanisms within the muscle tendon unit elastic strain energy etc
