**Geographical Genetics (MPB-38)** Bryan K. Epperson, 2003-08-31 Population genetics has made great strides in applying statistical analysis and mathematical modeling to understand how genes mutate and spread through populations over time But real populations also live in space Streams mountains and other geographic features often divide populations limit migration or otherwise influence gene flow This book rigorously examines the processes that determine geographic patterns of genetic variation providing a comprehensive guide to their study and interpretation Geographical Genetics has a unique focus on the mathematical relationships of spatial statistical measures of patterns to stochastic processes It also develops the probability and distribution theory of various spatial statistics for analysis of population genetic data detailing exact methods for using various spatial features to make precise inferences about migration natural selection and other dynamic forces The book also reviews the experimental literature on the types of spatial patterns of genetic variation found within and among populations And it makes an unprecedented strong connection between observed measures of spatial patterns and those predicted theoretically Along the way it introduces readers to the mathematics of spatial statistics applications to specific population genetic systems and the relationship between the mathematics of space time processes and the formal theory of geographical genetics Written by a leading authority this is the first comprehensive treatment of geographical genetics It is a much needed guide to the theory techniques and applications of a field that will play an increasingly important role in population biology and ecology

**Niche Construction** F. John Odling-Smee, Kevin N. Lala, Marcus Feldman, 2013-02-15 The seemingly innocent observation that the activities of organisms bring about changes in environments is so obvious that it seems an unlikely focus for a new line of thinking about evolution Yet niche construction as this process of organism driven environmental modification is known has hidden complexities By transforming biotic and abiotic sources of natural selection in external environments niche construction generates feedback in evolution on a scale hitherto underestimated and in a manner that transforms the evolutionary dynamic It also plays a critical role in ecology supporting ecosystem engineering and influencing the flow of energy and nutrients through ecosystems Despite this niche construction has been given short shrift in theoretical biology in part because it cannot be fully understood within the framework of standard evolutionary theory Wedding evolution and ecology this book extends evolutionary theory by formally including niche construction and ecological inheritance as additional evolutionary processes The authors support their historic move with empirical data theoretical population genetics and conceptual models They also describe new research methods capable of testing the theory They demonstrate how their theory can resolve long standing problems in ecology particularly by advancing the sorely needed synthesis of ecology and evolution and how it offers an evolutionary basis for the human sciences Already hailed as a pioneering work by some of the world's most influential biologists this is a rare potentially field changing contribution to the biological sciences

**Niche Construction** John Odling-Smee, 2024-09-03 How

niche construction theory extends evolutionary theory beyond natural selection to a more general theory about the coevolution of organisms with their environments In Niche Construction John Odling Smee the leading authority on niche construction theory extends evolutionary theory from an explanation of how populations of organisms respond to natural selection pressures in their environments to a more general theory about the coevolution of organisms with their environments Organisms he shows cause changes in their local external environments by interacting with them thereby contributing in fundamental ways to their own and one another s evolution This book applies niche construction theory to current problems such as human induced global warming and suggests how humans might contribute positively to the future evolution of life on Earth Odling Smee explains how orthodox evolutionary theory falls short in two ways First it does not describe how organisms contribute to their own and one another s evolution through their environment changing niche constructing activities Second it fails to explain how genetic evolution can give rise to supplementary knowledge gaining processes in many species These include certain developmental processes in individual organisms and socio cultural processes in animals including humans Neo Darwinism the author writes assesses the fitness of individual organisms in populations in terms of their capacity to survive and reproduce but without attributing these capacities to the active purposeful agency of organisms He argues that the purposeful agency of individual organisms plays a central role in evolution He also discusses the relationship of an organism s energy consuming activities and the second law of thermodynamics

**Niche Construction and the Role of Environment** Lynn Chiu, 2015 I argue that natural selection explanations are not necessarily externalist i e they don t always cite features of the environment as explanans In the first chapter I argue against the Propensity Interpretation of Fitness which attributes fitness to internal abilities of individuals in a common environment the latter dictating the selection of the population However for some populations individuals construct different internal external boundaries preventing an explanatory boundary between internal and external at the level of the population In the second chapter I argue that niche construction the ability of organisms to construct their experienced environments can be either constitutive of or alternative to natural selection Both reject explanatory externalism a core feature of Adaptationism An example of the latter is Niche Construction Theory which decomposes population and environment into distinct evolutionary causes Niche construction is from population to environment while natural selection is from environment to population An example of the former is Dialectical Biology and Situated Adaptationism which show that population and environment resist decomposition into internal and environmental evolutionary causes In the last chapter I demonstrate that general Darwinism in organization theory explicitly assumes externalism When organizations actively construct their conditions the debates assume that natural selection do not occur or is ineffective My previous analyses can show that selection occurs even when the organizations are constructing their external conditions
