Epithelial-Mesenchymal Plasticity in Cancer Metastasis Mohit Kumar Jolly, Toni Celia-Terrassa, 2020-12-29 Recent studies have highlighted that epithelial mesenchymal transition EMT is not only about cell migration and invasion but it can also govern many other important elements such as immunosuppression metabolic reprogramming senescence associated secretory phenotype SASP stem cell properties therapy resistance and tumor microenvironment interactions With the on going debate about the requirement of EMT for cancer metastasis an emerging focus on intermediate states of EMT and its reverse process mesenchymal epithelial transition MET offer new ideas for metastatic requirements and the dynamics of EMT MET during the entire metastatic cascade Therefore we would like to initiate discussions on viewing EMT and its downstream signaling networks as a fulcrum of cellular plasticity and a facilitator of the adaptive responses of cancer cells to distant organ microenvironments and various therapeutic assaults We hereby invite scientists who have prominently contributed to this field and whose valuable insights have led to the appreciation of epithelial mesenchymal plasticity as a more comprehensive mediator of the adaptive response of cancer cells with huge implications in metastasis drug resistance tumor relapse and patient survival **Dynamics of cyclic nucleotide signaling in neurons** Pierre Vincent, Nicholas C.

Spitzer, 2015-09-16 Cyclic nucleotides control a number of neuronal properties including neuronal differentiation pathfinding regulation of excitability and synaptic transmission and control of gene expression Signaling events mediated by cAMP or cGMP are transient and take place within the complex 3 dimensional structure of the neuronal cell Signaling events happen on the time scale of seconds to minutes and the biological significance of the temporal dimension remains poorly understood Structural features of neurons dendritic spines and branches cell body nucleus axon as well as AKAPs and other scaffolding proteins that keep signaling enzymes together and form signaling microdomains are critical spatial determinants of signal

integration Finally the types of enzymes involved in signal integration which are expressed as a number of different types and splice variants yield another dimension that determines signal integration properties Biosensor imaging provides direct temporal and spatial measurement of intracellular signals This novel approach together with more conventional methods such as biochemistry electrophysiology and modeling now provide a better understanding of the spatial and temporal features of cyclic nucleotide signal integration in living neurons This topic aims at providing a better understanding of how neurons are making sense of cyclic nucleotide signaling in living neurons

The Role of Mitochondria, Oxidative Stress and Altered Calcium Homeostasis in Amyotrophic Lateral Sclerosis: From Current Developments in the Laboratory to Clinical Treatments Manoj Kumar Jaiswal, 2017-04-17

Amyotrophic lateral sclerosis ALS is a rapidly progressive devastating and fatal disease characterized by selective loss of upper and lower motor neurons of the cerebral cortex brainstem spinal cord and muscle atrophy In spite of many years of research the pathogenesis of ALS is still not well understood ALS is a multifaceted genetic disease in which genetic susceptibility to motor neuron death interacts with environmental factors and there is still no cure for this deleterious disease At present there is only one FDA approved drug Riluzole which according to past studies only modestly slows the progression of the disease and improves survival by up to three months The suffering of the ALS patients and their families is enormous and the economic burden is colossal There is therefore a pressing need for new therapies Different molecular pathways and pathological mechanisms have been implicated in ALS According to past studies altered calcium homeostasis abnormal mitochondrial function protein misfolding axonal transport defects excessive production of extracellular superoxide radicals glutamate mediated excitotoxicity inflammatory events and activation of oxidative stress pathways within the mitochondria and endoplasmic reticulum can act as major contributor that eventually leads to loss of connection between muscle and nerve ultimately resulting to ALS However the detailed molecular and cellular pathophysiological mechanisms and origin and temporal progression of the disease still remained elusive Ongoing research and future advances will likely advance our improve understanding about various involved pathological mechanism ultimately leading to discoveries of new therapeutic cures Importantly clinical biomarkers of disease onset and progression are thus also urgently needed to support the development of the new therapeutic agents and novel preventive and curative strategies Effective translation from pre clinical to clinical studies will further require extensive knowledge regarding drug activity bioavailability and efficacy in both the pre clinical and clinical setting and proof of biological activity in the target tissue During the last decades the development of new therapeutic molecules advance neuroimaging tools patient derived induced stem cells and new precision medicine approaches to study ALS has significantly improved our understanding of disease In particular new genetic tools neuroimaging methods cellular probes biomarker study and molecular techniques that achieve high spatiotemporal resolution have revealed new details

about the disease onset and its progression In our effort to provide the interested reader clinician and researchers a comprehensive summaries and new findings in this field of ALS research hereby we have created this electronic book which comprises of twenty seven chapters having various reviews perspective and original research articles All these chapters and articles in this book not only summarize the cutting edge techniques approaches cell and animal models to study ALS but also provide unprecedented coverage of the current developments and new hypothesis emerging in ALS research Some examples are novel genetic and cell culture based models mitochondria mediated therapy oxidative stress and ROS mechanism development of stem cells and mechanism based therapies as well as novel biomarkers for designing and testing effective therapeutic strategies that can benefit ALS patients who are at the earlier stages in the disease I am extremely grateful to all the contributors to this book and want to thank them for their phenomenal efforts Manoj Kumar Jaiswal Ph D February 5 2017 New York NY

New Advancement in Tumor Microenvironment Remodeling and Cancer Therapy Xiangsheng Zuo,Ying Shen,Yi Yao, Jiayan Chen,2024-03-18 Tumor microenvironment TME refers to the area with non malignant cells signaling molecules and blood vessels that surrounds and feeds tumor cells A tumor can change its microenvironment and TME is also known to profoundly impact the occurrence growth metastasis and therapeutic response and resistance of tumors The special paracrine characteristics microvascular system extracellular matrix components and stromal cells in TME promote local tumor immune suppression and could alter the penetration and distribution of drugs into tumor tissues Accumulating evidence demonstrates that currently available tumor therapies i e chemotherapy radiotherapy anti vascular therapy small molecule targeted therapy immune checkpoint inhibitors also in turn greatly affect the structure function and physical and chemical properties of TME leading to TME remodeling However whether and how interaction of tumor cells and TME modeling can be dissected and targeted to further understand the underlying molecular mechanisms and establish effective new tumor therapies remains elusive
