Office of National Marine Sanctuaries Science Review of Artificial Reefs NOAA Office of National Marine Sanctuaries, 2014-01-31 Artificial reefs are human made structures that are either deliberately or unintentionally submerged underwater commonly with the result of mimicking some characteristics of a natural reef Artificial reefs alter local habitat by providing hard substrate and complex vertical relief where typically none previously existed Bohnsack and Sutherland 1985 Sheehy and Vik 1992 Sheehy and Vik 2010 They may be created from a variety of sources and materials including the intentional sinking of ships and barges rubble concrete rocks stone boulders steel and metal etc Baine 2001 They may also be created through unintentional means e g shipwrecks that can become historical in nature and through structures built for other purposes e g decommissioned oil and gas platforms breakwaters jetties bridges offshore lighthouses air force towers navigational aids marine data buoys etc These various materials have benefits and drawbacks when used in artificial reef construction

Gulf of Mexico Reefs: Past, Present and Future Adrienne M. S. Correa, Nancy Knowlton, Joshua D. Voss, Daniel M. Holstein, Rowan C. Martindale, 2021-09-28 Florida Keys National Marine Sanctuary: Development of the management plan : environmental impact statement, 1996 *Interrelationships Between Corals and Fisheries* Stephen A. Bortone, Ph.D., 2014-07-17 *Interrelationships Between Corals and Fisheries* is derived from a workshop held by the Gulf of Mexico Fishery Management Council in Tampa Florida in May 2013 where world authorities came together to discuss the current problems in managing tropical fisheries and offered suggestions for future directions for both researchers and environmental resource managers This book addresses current and emerging threats as well as challenges and opportunities for managing corals and associated fisheries It provides an information baseline toward a better understanding of how corals and the consequences of coral condition influence fish populations especially as they relate to management of those populations The book contains content from presentations modified as a result of interactions and discussions with colleagues and peer reviews by global experts in corals and fisheries Many chapters include additional materials not presented in the workshop There are also papers that were not presented at the workshop but contribute to the central theme of the book Topics covered include Global decline in coral reefs and impacts on fishery yields Distribution and diversity in the Gulf of Mexico Implementation of Coral Habitat Areas of Particular Concern CHAPCs Deepwater coral sponge habitats Coral populations on offshore platforms Mangrove connectivity for sustaining coral reef fisheries Restoring deepwater coral ecosystems and fisheries after the Deepwater Horizon oil spill Predictive mapping of coral reef fish Covering a range of subject matter most of the chapters offer suggestions for future research on the interrelationships between corals and fisheries In addition the final chapter presents a summary on these interrelationships and discusses managing them for the future Marine Ecosystem Restoration (MER) – Challenges and New Horizons Brian Silliman, Avigdor Abelson, Christine Angelini, Gesche

Krause, Megan Irene Saunders, Tjisse Van Der Heide, 2023-10-23 Worldwide marine ecosystems have been lost and degraded due to anthropogenic disturbances. For example, oyster reefs have declined by at least 85%, coral reefs by 19%, seagrasses by 29%, North American salt marshes by 42%, and mangroves by 35% from the early 19th century. Deepwater reefs and deep-sea vents are not immune and have also been reduced in extent in many areas. Factors driving these losses include habitat destruction, pollution, invasive species, overfishing, trawling, mining, and more recently, climate change effects such as ocean warming, species range changes, and acidification. These habitat declines are occurring at a time when marine waters are being used at or near their maximum productive capacity to meet the contemporary needs of an ever-increasing human population. Because coastal and marine ecosystems generate some of the richest biodiversity hotspots on Earth and provide critical ecosystem services including storm protection, fisheries production, and carbon storage, over 1 billion US dollars have been spent globally in an attempt to halt and reverse observed declines. Early conservation efforts aimed at protecting these valuable and threatened habitats focused on reducing human impacts and physical stressors. However, with habitat degradation continuing and sometimes increasing in rate, it is now clear that conservation alone will not be sufficient to protect and reestablish coastal ecosystems. Habitat restoration, although in existence for many decades, has recently been elevated as a new primary strategy to stem and even reverse coastal habitat loss. The call for increasing investment in restoration efforts has emerged with significant advances in propagule rearing and dispersion of habitat-forming organisms, e.g., oysters, seagrasses, corals. In addition, restoration resources are increasingly allocated by governments and/or large corporations with the aim to, for example, fix past landscape engineering efforts that had unintended environmental consequences. Such investments are being made to: i) provide jobs for those unemployed during economic downturns; ii) restore ecosystems destroyed by natural disasters and stressors; iii) increase coastal defense in response to increased frequency of intense storms; and/or iv) compensate for pollution and development-driven habitat degradation. Conservation practitioners have traditionally been skeptical to invest heavily in restoration at large scales because of the high cost per area (10 000–5 000 000 US ha for coastal vs. 500–5 000 US ha for terrestrial systems) to replant coastal ecosystems and/or the high chance that the restored ecosystems will not live long, e.g., outplanted corals. For restoration to be effective and employed as a primary method of coastal conservation at relevant scales, we must improve its efficiency, lower costs, and rapidly share and incorporate advances. One crucial step will be to identify when and where restoration attempts have been carried out according to state-of-the-art ecological theory and gauge their success. Another is generating synthesis studies that focus both within and across ecosystems to identify efficiencies, adaptations, and innovations. Work that shows theoretical and methodological innovations in specific ecosystems as well as across systems will be critical to pushing all fields of MER forward. Although there is rapidly increasing interest and investment, the field of marine ecosystem restoration is just beginning to undergo synthesis. Therefore, the aim of this Research Topic is to bring together research contributions to help address this synthesis need, provide a
