Introduction

Fish and fishery products constitute an important food component for a large section of world population, more so in developing countries, where fish forms a cheap source of protein. In the last two decades there has been an increase in awareness about the nutritional and health benefits of fish consumption. The low fat content of some fish and the presence of poly unsaturated fatty acids in red meat fishes which are known to reduce the risks of coronary heart diseases, have increased the dietary and health significance of seafood consumption (Din et al., 2004). In USA, seafood consumption has increased from an average of 4.5 kg per person in 1960 to about 7.0 kg per person in 2002 (NOAA, 2003). Total fishery production in 2001 was reported to be 130.2 million tonnes, of which 37.9 (30%) million tonnes was from aquaculture, 90% of which came from Asian countries. On the other hand, seafood is also known to have been responsible for a significant percentage of food borne diseases. With increased fish consumption, there is also an increase in the number of food-borne illness associated with fishery products. In the United States, 10-19% of food-borne illness involved seafood as a vehicle and between 1993 and 1997, 6.8% of the food-borne illnesses involved consumption of fish and shellfish (FAQ, 2004). In Japan, where seafood consumption is high and raw fish consumption is popular, 70% of food-borne illness is attributed to seafood. These data highlight the importance of seafood as vehicles for human illness.

However, the true incidence of seafood-borne diseases worldwide is not known, as there is no surveillance system in the developing countries. In addition to being responsible for human health problems, the presence of infectious agents in seafood results in rejection of seafood consignments leading to major economic losses to exporting countries in general, and to seafood processing industries in particular. Maintenance of seafood quality is central to ensuring the safety of seafood. This has been a major area of concern for seafood processing industries and a great challenge to scientists and researchers worldwide. This review focuses on agents

and causes of human illness encountered in seafood and issues related to seafood safety and quality management.

Causes of seafood-borne illness

Seafood often harbour infectious agents that are present naturally in the aquatic environment or introduced through human activities. The illness may be due to the infection caused by the micro-organism or due to the intoxication by products of microorganisms. Viruses, bacteria and parasites are the agents of human disease associated with seafoods. The products of microorganism such as bacterial toxins, algal toxins or products of bacterial metabolism such as histamine can cause intoxication when fish or shellfish harbouring these products are consumed. In the case of live finfish, microorganisms may be associated with gill, gut and skin. Filter feeding shellfish like mollusks concentrate different types of microorganisms present in the environment around them. Some of the microorganisms of human health concern may be native to the aquatic environment such as the members of the genus *Vibrio* but others like *Salmonella*, *E. coli* and many viruses are introduced into the aquatic environment through human activities such as contamination by domestic sewage. The type of microorganism associated with seafood may vary depending upon whether it is fresh or processed. Most of the outbreaks of illnesses occur in countries where seafood is eaten raw or is inadequately cooked. For example, in Japan where seafood is eaten raw, 70% of food borne human illness is seafood associated (Scoging 2003).

Viruses associated with seafoods

Viruses constitute an important cause of seafood borne diseases. The intensity of human illness is known only from developed countries. For example in the USA, it is estimated that 80% of food borne illness are due to enteric viruses (Sair et al., 2002). The major limitation in diagnosing viral infections is the non-availability of techniques or facilities for detecting or identifying viral pathogens. The recent advances in

Furthermore, this text explains the means of controlling the process and the microbial content. Each chapter is a review of applied microbiology compiled by leading authorities selected solely for their expert knowledge. The final chapter emphasizes factors that contribute to outbreaks of foodborne disease. This volume will greatly appeal to those interested primarily in applied aspects of food microbiology such as food processors, microbiologists and technologists, veterinarians, public health workers and regulatory officials.

Fish Fermentation Debabrata Baishya, 2009-01-15 *Fish Fermentation: Traditional to Modern Approaches* is the first of its kind geared specifically for students interested in pursuing a career in Food Biotechnology and especially in Fish Processing Technology. There is information about fermented fish from Southeast Asia. Products from this region are highly salted and fermented until the fish flesh is transformed into simpler components and the fermentation process lasts for several months, three to nine months, and the fish flesh may liquefy or turn into a paste. Fermented fish products from the north eastern part of India share many common features with that from other Southeast Asian countries. Still, some of the steps in the fermentation process are unique to the Northeast India. More over, the scenario varies with the varieties of the fermented fish items. This book aims at bringing out not only the scientific basis of the fermentation process but also endeavors to cite the present market status of the fermented fish. With its balanced coverage of historical development, microbial diversity, nutritional aspects and contemporary application, the book provides the tools and basic knowledge necessary for success in this industry. Special sections on Probiotics and Fermented Fish Starter Culture in Fish Fermentation are in great detail, which is the outcome of various research works. This book is therefore suitable for undergraduate, postgraduate as well as research students. The first chapter, *Fermented Food Products in India*, depicts about various fermented food items available in India and international scenario is also highlighted. The second chapter, *Traditional Fish Preservation Techniques*, gives an idea of traditional system of fish preservation in various parts of the world, which will surely help the students as well as the research students to carry out various projects in this field and in designing the protocol for standardization of fish preservation technique. The third chapter, *Microbial Diversity*, describes about the world of microbes in the fermented fish products, their role in fermentation, desirable and associated types of microbes in fish fermentation, the spoilage group of microbes involved in fish fermentation.

pathogenic microbes and possible health hazards the beneficial group of microbes in the process and the relevant data of various research works In the fourth chapter Nutritional Aspects of Fermented Fish the nutritional value of a variety of fermented fish products are highlighted their role as an important protein supplement for many nutritional diseases is also projected This chapter will give a basic idea of nutritional quality of fermented fish products Chapter 5 and Chapter 6 are mainly aimed at introducing cutting edge technology in the field of fish fermentation which in turn is the result of the advent of modern biotechnological tools
