macroorganisms in the surrounding seawater Host associated microorganisms have been shown to produce secondary metabolites as defense molecules against unwanted colonization or pathogens thus having an important function in host health and survival Similarly microbial symbionts of sessile eukaryotes are often essential players in local nutrient cycling thus benefiting both the host and the surrounding ecosystem Various research fields have contributed to generating knowledge of host associated systems including microbiology biotechnology molecular biology ecology evolution and biotechnology Through a focus on model marine sessile host systems we believe that new insight into the interactions between host and microbial symbionts will be obtained and important areas of future research will be identified This research topic includes original research review and opinion articles that bring together the knowledge from different aspects of biology and highlight advances in our understanding of the diversity and function of the microbiomes on marine sessile hosts
