**Hydraulic Fracturing Treatment for Maximization of the Tight Gas Productivity** Mengting Li, 2018-12-17 Hydraulic fracturing is essential technology for the development of unconventional resources such as tight gas. So far there are no numerical tools which can optimize the whole process from geological modeling hydraulic fracturing until production simulation with the same 3D model with consideration of the thermo hydro mechanical coupling. In this dissertation a workflow and a numerical tool chain were developed for design and optimization of multistage hydraulic fracturing in horizontal well regarding a maximum productivity of the tight gas wellbore. After the verification a full 3D reservoir model is generated based on a real tight gas field in the North German Basin. Through analysis of simulation results a new calculation formula of FCD was proposed which takes the proppant position and concentration into account and can predict the gas production rate more accurately. However not only FCD but also proppant distribution and hydraulic connection of stimulated fractures to the well geological structure and the interaction between fractures are determinant for the gas production volume. Through analysis the numerical results of sensitivity analysis and optimization variations there is no unique criterion to determine the optimal number and spacing of the fractures it should be analyzed firstly in detail to the actual situation and decided then from case to case      **Structural Characterisation of Natural and Industrial Porous Materials: A Manual**

Sean Patrick Rigby, 2020-05-15 This book focuses on structural characterisation techniques for porous materials. Covering a range of techniques including gas sorption mercury porosimetry thermoporometry NMR and imaging methods this practical guide presents the basic theory behind each characterisation technique and discusses the practicalities of the experimental and data analysis approaches needed for complex industrial samples. The book shows readers how to approach characterising a particular sort of material for the first time and then how to develop a strategy for more in depth analysis. It also demonstrates how to determine the best techniques for solving particular problems and describes methods of obtaining the required information as well as the limitations of various methods. It particularly highlights a scientific approach involving parameter validation and simple acquisition. Featuring examples taken from case studies of real world industrial materials this book is intended for industrial practitioners and researchers. It provides a manual of potential techniques and answers questions concerning porous materials that arise in areas such as the catalyst industry the oil and gas sector batteries fuel cells tissue engineering scaffolds and drug delivery devices      *Manual of the Natural History, Geology, and Physics of*
