Otis Field Installation Manual:

Fish Passage Through Culverts Calvin O. Baker, Frank E. Votapka, Technology & Development Center (Missoula, Mont.), 1990 The success of fish migration through culverts is dependent on the swimming ability of the fish and the hydraulic conditions of the culvert Properly designed and constructed culverts can minimize the impact on fish passage Because culverts are typically more economical than bridges it is appropriate to evaluate when to use culverts and to predict the effects of such culvert installations During the consideration of alternatives for structures for fish passage culverts should not be automatically eliminated This publication has tried to examine the aspects of culvert design and operation relative to the existing information that has been published in previous studies Ideally a culvert installation should not change the conditions that existed prior to that installation This means that the cross sectional area should not be restricted by the culvert the slope should not change and the roughness coefficients should remain the same Any change in these conditions will result in a velocity change which could alter the sediment transportation capacity of the stream A truly successful culvert design would include matching the velocities of the fish's swimming zone in the culvert to the swimming capacity of the design fish Unfortunately not enough research has been completed to make this an acceptable criterion of culvert design This approach is preferred because it is easier to reduce the velocities in the swimming zone by increasing the boundary roughness than it is to reduce the mean velocity of the entire culvert This publication contains some relatively simple guidelines which can reduce the installation problems of culverts in streams containing migrating fish when combined with the expertise of an experienced fish biologist, engineer and hydrologist

Subsurface Contamination Monitoring Using Laser Fluorescence Katharine Balshaw-Biddle, Carroll L. Oubre, C. H. Ward, 2019-08-16 While innovative technologies in remediation need to be developed so do innovative ways of site assessment This monograph describes the development, testing and performance of a new laser induced fluorescence soil probe A screening tool for site characterization this probe has the potential to provide an economical rapid assessment of contaminated sites Cone Penetrometer testing equipment advances the probe into the subsurface The probe identifies hydrocarbon classes using a multi channel excitation emission matrix This technique facilitates the collection of significant amounts of subsurface information surpassing conventional data collection methods that can be used to rapidly identify areas of concern beneath a site The technology has significant application for the following Rapid environmental site assessment Monitoring remediation programs Monitoring manufacturing processes and industrial waste water operations Subsurface Contamination Monitoring Using Laser Fluorescence provides comprehensive reference material for researchers and engineers as well as engineering consultants interested in subsurface monitoring techniques or further development of this technology It describes innovative technology that focuses on finding cost effective solutions for site assessment and remediation
