Comparative Osteology Bradley Adams,Pam Crabtree,2011-08-12 In the forensic context it is quite common for nonhuman bones to be confused with human remains and end up in the medical examiner or coroner system It is also quite common for skeletal remains both human and nonhuman to be discovered in archaeological contexts While the difference between human and nonhuman bones is often very striking it can also be quite subtle Fragmentation only compounds the problem The ability to differentiate between human and nonhuman bones is dependent on the training of the analyst and the available reference and or comparative material *Comparative Osteology* is a photographic atlas of common North American animal bones designed for use as a laboratory and field guide by the forensic scientist or archaeologist The intent of the guide is not to be inclusive of all animals but rather to present some of the most common species which also have the highest likelihood of being potentially confused with human remains An affordably priced compact laboratory field manual comparing human and nonhuman bones Contains almost 600 high quality black and white images and diagrams including inch and centimeter scales with each photograph Written by the foremost forensic scientists with decades of experience in the laboratory and as expert witnesses An additional Companion Web site hosts images from the volume the reader can magnify and zoom into to see specific landmarks and features on bones <http://booksite.academicpress.com/9780123884374>

France, 2010-11-30 In Human and Nonhuman Bone Identification A Color Atlas Diane L France one of the most respected forensic anthropologists in the world offered a comprehensive handbook of photographs and other information essential for examining skeletal remains and determining species and body parts Conveniently designed for field use this compact version of **Comparative Osteology** Bradley Adams, Pam Crabtree, 2011-11-30 Comparative Osteology is a photographic atlas of common North American animal bones designed for use as a laboratory and field guide by the forensic scientist or archaeologist *Nonhuman Bone Identification* Heather A. Walsh-Haney, Jason H. Byrd, Sharon Jones, 2009-03-15 The skills involved in nonhuman bone identification may take non experts years to learn and some identifications require direct sample comparisons Therefore a photo driven field guide is in great demand This book provides scale photos of nonhuman bones that are typically found in forensic contexts which are often mistaken for human skeletal material as well as photos of taphonomic occurrences that typify postmortem change in nonhuman material The book shows how to prepare specimens for skeletal analysis and photograph them properly and includes case studies and exclusion matrices It also includes geographic distribution information on forensically significant animals reptiles and fish **Human Vs Non-human Bone** B. Corrieri, 2018 *Long Bone Morphometrics for Human from Non-human Discrimination* Bree Saulsman, University of Western Australia. Centre for Forensic Science, 2010 Forensic anthropologists are frequently required to confirm the human origin of complete and partial skeletal remains This determination however can be difficult for bone fragments with few or no distinctive morphological landmarks Current methods of distinguishing human from non human bone fragments include microscopic immunological and DNA testing which are each limited to some degree e g time consuming and expensive The purpose of this study is to investigate an alternative morphometric approach to quantify the external structure of human long bones humeri femora tibiae compared to quadrupedal sheep dog pig and bipedal kangaroo emu animals commonly found in Australia Eight traditional linear measurements were taken on a sample of 50 human and at least 10 of each of the five non human species measurements were then analysed using ANOVA canonical variates analysis CVA and direct discriminant analysis The results from ANOVA and CVA indicate morphometric variation between the six species five for the humerus which were able to be correctly classified into their corresponding groups with a high degree of expected accuracy humerus 70 97 8% femur 70 9 97 3% and tibia 72 4 96 2% Direct discriminant analysis further separated the human from the combined non human species with a cross validated classification accuracy of 95% or higher More importantly however the technique also proved to be accurate if only a fragment of the diaphysis is analysed classification accuracy 63 99% As it may not always be possible to accurately determine the known midshaft of a bone especially if only a

relatively small fragment is available the potential forensic utility of a method requiring a whole bone has to be considered In order to assess whether the power to discriminate between humans and non humans is significantly reduced if measurements are taken up to 2cm above and below the known midshaft a series of measurements antero posterior diameter medio lateral diameter and midshaft circumference were taken on 17 human and 50 pooled non human species 40 for the ii humeri Overall it was found that there is only a small degree of size variation within 2cm above or below the known midshaft with relatively low average standard deviation ranges for the three human and non human bones humerus 0 420 2 2 05 mm femur 0 345 0 586 mm tibia 1 034 2 676 mm Not knowing the precise location of the midshaft on classification accuracy was also shown to have a relatively small impact especially for the tibia which appears to be the bone of choice for attempting to distinguish between the human and non human species considered in the present study This study has provided strong evidence that quantifying the external structure of long bones is a forensically viable technique for species discrimination This project has also shown that morphometric methods can be successfully applied for human from non human identification when remains are fragmentary and lack diagnostic muscle attachment marks or articular regions Overall the results of this study have outlined a forensically useful non invasive method to distinguish human from non human bones **Comparative Cortical Bone Thickness in Human and Non-human Mammal Long Bones** Sarah L.
