Emerging Sustainable and Green Technologies for Improving Agricultural Production Ruonan Ma, Zhen Jiao, Gyungsoon Park, Libin Zhou, 2025-10-01. Nowadays the world is facing food shortages with the increasing global population, decreasing food sources, and deteriorating environment. Traditionally, several strategies have been employed to improve agricultural production, including physical methods (e.g., seed priming, stratification, scarification, and ultrasound) and chemical methods (e.g., disinfectants, fungicides, hormones, and fertilizers). However, most of these methods have their own limitations. For example, some methods require expensive and sophisticated equipment, and some approaches are inefficient, time-consuming, and impractical. The current agricultural production relies on a large number of chemical fertilizers, pesticides, and some other chemicals to guarantee high agricultural output, which inevitably causes environmental pollution and directly threatens human health. Recently, a number of emerging sustainable and green technologies, such as atmospheric cold plasma, ion beams, and nanoparticles, are becoming increasingly popular in agriculture, which can be applied in seed sterilization, plant disease control, improvement of seed germination and seedling growth, and enhancement of plant resistance against various stresses. These technologies can be promising alternatives to conventional methods for improving crop yields. However, the mechanisms underlying the biological effects induced by the emerging sustainable and green technologies are still unclear.
