Pancreatic Cancer Methods And Protocols Methods In Molecular Biology:

Pancreatic Cancer Gloria H. Su, 2008-02-01 Pancreatic ductal adenocarcinoma is the fourth leading cause of cancer death in the United States. Annually approximately 30 000 Americans are diagnosed with the disease and most will die from it within five years. Pancreatic ductal adenocarcinoma is unique because of its late onset in age, high mortality, small tumor samples infiltrated with normal cells, and a lack of both early detection and effective therapies. Some of these characteristics have made studying this disease a challenge. Pancreatic cancer develops as a result of the accumulation of genetic alterations in cancer-causing genes such as the oncogenes and the tumor suppressor genes. In the last decade, major progress has been made in identifying important oncogenes and tumor suppressor genes for the disease. In *Pancreatic Cancer Methods and Protocols*, we review the classical techniques that have contributed to the advances in pancreatic research and introduce new strategies that we hope will add to future breakthroughs in the field of cancer biology. *Pancreatic Cancer Methods and Protocols* provides a broad range of protocols for molecular, cellular, pathological, and statistical analyses of sporadic and familial pancreatic cancer. It covers topics from in vitro cell cultures to in vivo mouse models, DNA to protein manipulation, and mutation analyses to treatment development. We believe that our book will prove an invaluable source of proven protocols for those who are interested in either basic or translational research in pancreatic cancer. *Vascular Biology Protocols* Nair

Sreejayan, Jun Ren, 2008-07-25 Over the past decades, the pathogenesis, diagnosis, treatment, and prevention of cardiovascular diseases have been benefited significantly from intensive research activities. In order to provide a comprehensive manual in a field that has become as broad and deep as cardiovascular medicine, this volume of *Methods in Molecular Medicine* covers a wide spectrum of in vivo and in vitro techniques encompassing biochemical, pharmacological, and molecular biology disciplines which are currently used to assess vascular disease progression. Each chapter included in this volume focuses on a specific vascular biology technique and describes various applications as well as caveats of these techniques. The protocols included here are described in detail, allowing beginners with little experience in the field of vascular biology to embark on new research projects. ***Human Cell Culture Protocols*** Joanna Picot, 2008-02-02 A thoroughly revised and updated collection of readily reproducible techniques for culturing human cells. the most disabling diseases it is responsible for increasing financial and social burdens in terms of medical treatments forced inactivity loss of mobility and dependence Despite a growing awareness of OA as a medical problem that has yet to reach its maximum impact on society there is a surprising absence of effective medical treatments beyond pain control and surgery So far only symptom modifying drugs are available while there remains a major demand for disease modifying treatments of proven clinical efficacy This demand will hopefully be met in the future by some of the drugs that have been pressed into development and are now at different stages of clinical investigation Nevertheless the current lack of effective treatments reflects a still insufficient knowledge of cartilage with respect to its metabolism interactions with other joint tissues and causes and mechanisms possibly of very different nature leading to failure of its turnover Bone Marrow and Stem Cell Transplantation Meral Beksac,2007-05-03 This volume is a compendium of cutting edge molecular methods for the successful transplantation of hematopoietic stem cells The contributors are world renown leaders in the field They describe promising tools for stem cell transplant research models such as in vivo bioluminescence imaging They discuss HLA typing PCR SSP typing and HLA antigens This volume is an invaluable source for biochemists molecular biologists and clinicians *Cartilage and Osteoarthritis* Frédéric De Ceuninck,Massimo Sabatini,Philippe Pastoureau,2008-02-02 An indispensable collection of updated classical and emerging techniques that promise to add critical knowledge to our understanding of cartilage metabolism in health and disease Volume 1 Cellular and Molecular Tools describes proven molecular and cellular techniques for the in vitro study of normal and osteoarthritic cartilage through biochemical biomolecular immunological and physical approaches with emphasis on the genetic manipulation of cells Volume 2 Structure and In Vivo Analysis offers cutting edge procedures for the study at the tissue level of turnover structure and functioning of normal and diseased articular cartilage by invasive and noninvasive means Comprehensive and up to date the two volumes of Cartilage and Osteoarthritis provide researchers and bench scientists with readily reproducible protocols for new experiments to understand from the cellular to the animal level the pathophysiology of cartilage and to discover molecular targets for pharmacological intervention
