Description :

Palaeopathology is an evidence-based guide to the principal types of pathological lesions often found in human remains and how to diagnose them. Tony Waldron presents an innovative method of arriving at a diagnosis in the skeleton by applying what he refers to as 'operational definitions'. The method ensures that those who study bones will use the same criteria for diagnosing disease, thereby enabling valid comparisons to be made between studies. Waldron's book is based on modern clinical knowledge and provides background information on the natural history of bone disease. In addition, the volume demonstrates how results from studies should be analysed, methods of determining the frequency of disease, and other types of epidemiological analysis. This edition includes new chapters on the development of palaeopathology, basic concepts, health and disease, diagnosis, and spinal pathology. Chapters on analysis and interpretation have been thoroughly revised and enlarged.

Human Craniofacial Variation and Dental Anomalies: An anthropological investigation into the relationship between human craniometric variation and the expression of orthodontic anomalies Joseph R Krecioch,2014-11-01 Dental anomalies of number shape and position are frequently analysed in the orthodontic and clinical literature but are rarely discussed in an anthropological or archaeological context Dental anomalies and occlusal disorders are often hypothesised to be the result of a modern urbanised lifestyle as a response to reduced masticatory stress and subsequent crowding of the dentition This study of skulls from Classical to medieaval Macedonia and England examines the relationship between craniofacial variation and the expression of dental anomalies Standard craniometric measurements were taken to estimate relative sizes of cranial functional complexes and determine whether or not or to what extent changes in the shape or size of these variables were associated with the expression of dental anomalies Statistical analyses determined that the null hypothesis that there is no relationship between craniometrics and dental anomalies can be rejected A number of dental anomalies were found to have a relationship with reduced sizes in cranial and masticatory elements although dental crowding was not as significant a factor in masticatory complex reduction A cause and effect relationship cannot be determined but the data presented here suggests that both heredity and environmental causes may be influential in the expression of dental anomalies
