Paleoclimates Understanding Climate Change Past And Present:

Paleoclimates Thomas M. Cronin, 2010 When combined with computer model simulations paleoclimatic reconstructions are used to test hypotheses about the causes of climatic change such as greenhouse gases solar variability earth's orbital variations and hydrological oceanic and tectonic processes This book is a comprehensive state of the art synthesis of paleoclimate research covering all geological timescales emphasizing topics that shed light on modern trends in the earth's climate Book Jacket

Earth's Climate Evolution Colin P. Summerhayes, 2015-07-13 To understand climate change today we first need to know how Earth's climate changed over the past 450 million years Finding answers depends upon contributions from a wide range of sciences not just the rock record uncovered by geologists In Earth's Climate Evolution Colin Summerhayes analyzes reports and records of past climate change dating back to the late 18th century to uncover key patterns in the climate system The book will transform debate and set the agenda for the next generation of thought about future climate change The book takes a unique approach to the subject providing a description of the greenhouse and icehouse worlds of the past 450 million years since land plants emerged ignoring major earlier glaciations like that of Snowball Earth which occurred around 600 million years ago in a world free of land plants It describes the evolution of thinking in palaeoclimatology and introduces the main players in the field and how their ideas were received and in many cases subsequently modified It records the arguments and discussions about the merits of different ideas along the way It also includes several notes made from the author's own personal involvement in palaeoclimatological and palaeoceanographic studies and from his experience of working alongside several of the major players in these fields in recent years This book will be an invaluable reference for both undergraduate and postgraduate students taking courses in related fields and will also be of interest to historians of science and or geology climatology and oceanography It should also be of interest to the wider scientific and engineering community high school science students policy makers and environmental NGOs Reviews Outstanding in its presentation of the facts and a good read in the way that it intersperses the climate story with the author's own experiences This book puts the climate story into a compelling geological history Dr James Baker The book is written in very clear and concise prose and takes original enlightening and engaging approach to talking about ideas from the perspective of the scientists who promoted them Professor Christopher R Scotese A thrilling ride through continental drift and its consequences Professor Gerald R North Written in a style and language which can be easily understood by laymen as well as scientists Professor Dr Jörn Thiede What makes this book particularly distinctive is how well it builds in the narrative of change in ideas over time Holocene book reviews May 2016 This is a fascinating book and the author's biographical approach gives it great human appeal E Adlard

[Rising Seas](#) Vivien Gornitz, 2013-03-12 The Earth's climate is already warming due to increased concentrations of human produced greenhouse gases in the atmosphere and the specter of rising sea level is one of global warming's most far reaching threats Sea level will keep rising long after

greenhouse gas emissions have ceased because of the delay in penetration of surface warming to the ocean depths and because of the slow dissipation of excess atmospheric carbon dioxide Adopting a long perspective that interprets sea level changes both underway and expected in the near future Vivien Gornitz completes a highly relevant and necessary study of an unprecedented age in Earth's history Gornitz consults past climate archives to help better anticipate future developments and prepare for them more effectively She focuses on several understudied historical events including the Paleocene Eocene Thermal Anomaly the Messinian salinity crisis the rapid filling of the Black Sea which may have inspired the story of Noah's flood and the Storrega submarine slide an incident possibly connected to a sea level occurrence roughly 8 000 years old By examining dramatic variations in past sea level and climate Gornitz concretizes the potential consequences of rapid human induced warming She builds historical precedent for coastal hazards associated with a higher ocean level such as increased damage from storm surge flooding even if storm characteristics remain unchanged Citing the examples of Rotterdam London New York City and other forward looking urban centers that are effectively preparing for higher sea level Gornitz also delineates the difficult economic and political choices of curbing carbon emissions while underscoring through past geological analysis the urgent need to do so *Quaternary Ecology, Evolution, and Biogeography* Valentí Rull, 2020-03-06

Quaternary Ecology Evolution and Biogeography offers an introduction to the study of the ecological and evolutionary processes that have shaped our present biosphere under the influence of glacial interglacial cycles Written by an ecologist with paleoecological expertise this book reviews the climatic changes that have occurred during the last 2.6 million years along with the responses of organisms and ecosystems It offers an understanding of the evolutionary origin of extant biodiversity its biogeographical patterns and the composition of modern ecological communities In addition it explores human evolution and the influence of our activities on the biosphere especially in the last millennia This book offers the latest information on how studying the past can contribute to our understanding of present climate issues for a better future and is an ideal resource for researchers and students in the natural sciences **Paleoclimatology** Colin P.

Summerhayes, 2020-06-10 Life on our planet depends upon having a climate that changes within narrow limits not too hot for the oceans to boil away nor too cold for the planet to freeze over Over the past billion years Earth's average temperature has stayed close to 14-15°C oscillating between warm greenhouse states and cold icehouse states We live with variation but a variation with limits Paleoclimatology is the science of understanding and explaining those variations those limits and the forces that control them Without that understanding we will not be able to foresee future change accurately as our population grows Our impact on the planet is now equal to a geological force such that many geologists now see us as living in a new geological era the Anthropocene Paleoclimatology describes Earth's passage through the greenhouse and icehouse worlds of the past 800 million years including the glaciations of Snowball Earth in a world that was then free of land plants It describes the operation of the Earth's thermostat which keeps the planet fit for life and its control by interactions between

greenhouse gases land plants chemical weathering continental motions volcanic activity orbital change and solar variability It explains how we arrived at our current understanding of the climate system by reviewing the contributions of scientists since the mid 1700s showing how their ideas were modified as science progressed And it includes reflections based on the author's involvement in palaeoclimatic research The book will transform debate and set the agenda for the next generation of thought about future climate change It will be an invaluable course reference for undergraduate and postgraduate students in geology climatology oceanography and the history of science A real tour de force An outstanding summary not only of the science and what needs to be done but also the challenges that are a consequence of psychological and cultural baggage that threatens not only the survival of our own species but the many others we are eliminating as well Peter Barrett Emeritus Professor of Geology Antarctic Research Centre Victoria University of Wellington New Zealand What a remarkable and wonderful synthesis it will be a wonderful source of paleoclimate information and insights Christopher R Scotese Professor Department of Earth and Planetary Sciences Northwestern University Evanston IL USA

Smirnov, 2020-02-10 This book sets out to give a rigorous mathematical description of the greenhouse effect through the theory of infrared atmospheric emission In contrast to traditional climatological analysis this approach eschews empirical relations in favour of a strict thermodynamical derivation based on data from NASA and from the HITRAN spectroscopy database The results highlight new aspects of the role of clouds in the greenhouse effect

Historical Disasters in Context Andrea JANKU, Gerrit Schenk, Franz Mauelshagen, 2011-12-21 Growing concerns about climate change and the increasing occurrence of ever more devastating natural disasters in some parts of the world and their consequences for human life not only in the immediately affected regions but for all of us have increased our desire to learn more about disaster experiences in the past How did

disaster experiences impact on the development of modern sciences in the early modern era Why did religion continue to play such an important role in the encounter with disasters despite the strong trend towards secularization in the modern world What was the political role of disasters Historical Disasters in Context illustrates how past societies coped with a threatening environment how societies changed in response to disaster experiences and how disaster experiences were processed and communicated both locally and globally Particular emphasis is put on the realms of science religion and politics International case studies demonstrate that while there are huge differences across cultures in the way people and societies responded to disasters there are also many commonalities and interactions between different cultures that have the potential to alter the ways people prepare for and react to disasters in future To explain these relationships and highlight their significance is the purpose of this volume

The Green Marble David Turner, 2018-05-15 Humans have difficulty thinking at the global scale Yet as we come to understand our planet as a single interconnected complex system and encounter compelling evidence of human impact on Earth's climate and biosphere the need for a truly global effort is increasingly urgent In this concise and accessible text David P Turner presents an overview of global environmental change and a synthesis of research and ideas from the rapidly evolving fields of earth system science and sustainability science that is suitable for anyone interested in humanity's current predicaments and what we can do about them The Green Marble examines Earth's past contemporary human disruption and the prospects for global environmental governance Turner emphasizes the functioning of the biosphere the totality of life on Earth including its influence on geologic history its sensitivity to human impacts and its possible role in ameliorating climate change Relying on models of the earth system that synthesize vast amounts of monitoring information and recent research on biophysical processes The Green Marble describes a range of scenarios for our planetary home exploring the effects of anthropogenic greenhouse gas emissions and factors such as economic globalization Turner juxtaposes cutting edge ideas from both the geosciences and the social sciences to illustrate how humanity has arrived upon its current dangerous trajectory and how we might pull back from the brink of civilization challenging environmental change Growing out of the author's popular course on global environmental change The Green Marble is accessible to non science majors and provides a framework for understanding the complex relationship of humanity to the global environment

How Universities Can Help Create a Wiser World Nicholas

Maxwell, 2014-03-18 In order to make progress towards a better world we need to learn how to do it And for that we need institutions of learning rationally designed and devoted to helping us solve our global problems make progress towards a better world It is just this that we lack at present Our universities pursue knowledge They are neither designed nor devoted to helping humanity learn how to tackle global problems problems of living in more intelligent humane and effective ways That this book argues is the key disaster of our times the crisis behind all the others our failure to have developed our institutions of learning so that they are rationally organized to help us solve our problems of living above all our global

problems Having universities devoted almost exclusively to the pursuit of knowledge is a recipe for disaster Scientific knowledge and technological know how have unquestionably brought great benefits to humanity But they have also made possible even caused our current global crises above all the impending crisis of global warming In this lucid and provocative book Nicholas Maxwell argues convincingly that we need urgently to bring about a revolution in universities round the world so that their basic aim becomes wisdom and not just knowledge

The Cambridge World History: Volume 2, A World with Agriculture, 12,000 BCE-500 CE Graeme Barker,Candice Goucher,2015-04-16 The development of agriculture has often been described as the most important change in all of human history Volume 2 of the Cambridge World History series explores the origins and impact of agriculture and agricultural communities and also discusses issues associated with pastoralism and hunter fisher gatherer economies To capture the patterns of this key change across the globe the volume uses an expanded timeframe from 12 000 BCE 500 CE beginning with the Neolithic and continuing into later periods Scholars from a range of disciplines including archaeology historical linguistics biology anthropology and history trace common developments in the more complex social structures and cultural forms that agriculture enabled such as sedentary villages and more elaborate foodways and then present a series of regional overviews accompanied by detailed case studies from many different parts of the world including Southwest Asia South Asia China Japan Southeast Asia and the Pacific sub Saharan Africa the Americas and Europe

Facing the Sea of Sand Barry Cunliffe,2023-04-25 Northern Africa is dominated by the Sahara Desert stretching across the continent from the Atlantic Ocean to the Red Sea This book is about the people who lived around the edges of the Desert and the different ways in which they responded to its challenges establishing networks of communication across its expanse But the Sahara has not always been a desert From about 9000 BC the region began to enjoy a warm humid period allowing vegetation to flourish and wild animals to move in Humans soon followed practising pastoral economies but with the onset of harsher conditions once more

around 3000 BC the desert reclaimed its own. Since then fluctuations in climate have continued to affect the lives of people living around the desert fringes. The communities occupying the North African Coast and in the Nile Valley have come under the influence of the states dominating the Near East and the Mediterranean but those living in the Sahel to the south of the desert have developed their own distinctive cultures. The book tells the story of the growing links between the two worlds showing that Africa played a crucial part in the development of the Old World before it was drawn into the story of the New World.

Marine Geomorphometry Vanessa Lucieer, Margaret Dolan, Vincent Lecours, 2019-06-25. Geomorphometry is the science of quantitative terrain characterization and analysis and has traditionally focused on the investigation of terrestrial and planetary landscapes. However applications of marine geomorphometry have now moved beyond the simple adoption of techniques developed for terrestrial studies driven by the rise in the acquisition of high resolution seafloor data and by the availability of user friendly spatial analytical tools. Considering that the seafloor represents 71% of the surface of our planet this is an important step towards understanding the Earth in its entirety. This volume is the first one dedicated to marine applications of geomorphometry. It showcases studies addressing the five steps of geomorphometry: sampling a surface e.g. the seafloor; generating a Digital Terrain Model (DTM) from samples; preprocessing the DTM for subsequent analyses e.g. correcting for errors and artifacts; deriving terrain attributes and/or extracting terrain features from the DTM; and using and explaining those terrain attributes and features in a given context. Throughout these studies authors address a range of challenges and issues associated with applying geomorphometric techniques to the complex marine environment including issues related to spatial scale, data quality and linking seafloor topography with physical, geological, biological and ecological processes. As marine geomorphometry becomes increasingly recognized as a sub discipline of geomorphometry this volume brings together a collection of research articles that reflect the types of studies that are helping to chart the course for the future of marine geomorphometry.
