Molecular Complexes in Earth's Planetary, Cometary and Interstellar Atmospheres Andrei A. Vigasin, Zdenek Slanina, 1998 This book introduces systematically the concept of weakly bound complexes into the broad field of atmospheric sciences To fill up the gap between our rapidly expanding knowledge of the individual properties of Van der Waals and hydrogen bonded molecules and our understanding of their role in the atmospheric processes an ensemble of related topics are covered by a team of expert co authors The general properties of the weakly bound molecular complexes or clusters are discussed as well as their distribution in the planetary atmospheres Collision induced and dimeric absorption and emission are considered in the context of atmospheric spectroscopy The advanced experimental techniques which enable us to study the spectroscopic features of molecular complexes in the gas phase or which are adsorbed are reviewed The role of molecular complexes in the cometary atmosphere the Earth mesosphere and the atmospheres of the giant planets and some of their satellites are also discussed in detail

**Weakly Interacting Molecular Pairs: Unconventional Absorbers of Radiation in the Atmosphere** Claude Camy-Peyret, Andrei A. Vigasin, 2012-12-06 The Advanced Research Workshop entitled Weakly Interacting Molecular Pairs Unconventional Absorbers of Radiation in the Atmosphere was held in Abbaye de Fontevraud France from April 29 to May 3 2002 The meeting involved 40 researchers from 14 countries The goal of this meeting was to address a problem that the scientific community is aware of for many years Up now however the solution for this problem is far from satisfactory Pair effects are called unconventional in the title of this meeting In specific spectral domains and/or geophysical conditions they are recognized to play a dominant role in the absorption emission properties of the atmosphere Water vapor continuum absorption is among the most prominent examples Permanently improving accuracy of both laboratory studies and field observations requires better knowledge of the spectroscopic features attributable to molecular pairs which may form at equilibrium The Workshop was targeted both to clarify the pending questions and as far as feasible to trace the path to possible answers since the underlying phenomena are yet incompletely understood and since a reliable theory is often not available On the other hand the lack of precise laboratory data on bimolecular absorption is often precluding the construction of reliable theoretical models Ideally the knowledge accumulated in the course of laboratory studies should correlate with the practical demands from those who are carrying out atmospheric field measurements and space observations

Ehrenfreund,W.M. Irvine,T. Owen,Luann Becker,Jen Blank,J.R. Brucato,Luigi Colangeli,Sylvie Derenne,Anne Dutrey,Didier Despois,Antonio Lazcano,Francois Robert,2006-03-05 Astrobiology a new exciting interdisciplinary research field seeks to unravel the origin and evolution of life wherever it might exist in the Universe The current view of the origin of life on Earth is that it is strongly connected to the origin and evolution of our planet and indeed of the Universe as a whole We are fortunate to be living in an era where centuries of speculation about the two ancient and fundamental problems the origin of life and its prevalence in the Universe are being replaced by experimental science The subject of Astrobiology can be

approached from many different perspectives This book is focused on abiogenic organic matter from the viewpoint of astronomy and planetary science and considers its potential relevance to the origins of life on Earth and elsewhere Guided by the review papers in this book the concluding chapter aims to identify key questions to motivate future research and stimulate astrobiological applications of current and future research facilities and space missions Today's rich array of new spacecraft telescopes and dedicated scientists promises a steady flow of discoveries and insights that will ultimately lead us to the answers we seek

*Astronomical Origins of Life* B. Hoyle, N.C. Wickramasinghe, 2012-12-06 Living material contains about twenty different sorts of atom combined into a set of relatively simple molecules Astrobiologists tend to believe that abiotic material will give rise to life in any place where these molecules exist in appreciable abundances and where physical conditions approximate to those occurring here on Earth We think this popular view is wrong for it is not the existence of the building blocks of life that is crucial but the exceedingly complicated structures in which they are arranged in living forms The probability of arriving at biologically significant arrangements is so very small that only by calling on the resources of the whole universe does there seem to be any possibility of life originating a conclusion that requires life on the Earth to be a minute component of a universal system Some think that the hugely improbable transition from non living to living material can be achieved by dividing the transition into many small steps calling on a so called evolutionary process to bridge the small steps one by one This claim turns on semantic arguments which seek to replace the probability for the whole chain by the sum of the individual probabilities of the many steps instead of by their product This is an error well known to those bookies who are accustomed to taking bets on the stacking of horse races But we did not begin our investigation from this point of view

first part offers an overview of the main ideas on the origin of life as they developed from antiquity until the twentieth century The second more detailed part of the book examines contemporary theories and major debates within the origin of life scientific community Topics include Aristotle and the Greek atomists conceptions of the organism Alexander Oparin and J B S Haldane s 1920s breakthrough papers Possible life on Mars
