Education Roads Less Traveled Mitch Pearlstein, 2019-02-15 Every year large numbers of American young people who are not terribly interested in attending a four year college reluctantly enroll anyway effectively pressured by combinations of parents peers teachers guidance counselors and the normative air they breathe More than occasionally they wind up confirming that collegiate life is not for them and sooner or later drop out From there again more than occasionally they find themselves unemployed or underemployed in big time student debt and quite possibly feeling like a failure Cratered paths like these routinely stunt entries to middle class jobs and careers These are often needless delays and losses because other education and career routes are primed to better serve millions of young men and women especially those who enjoy working with their hands Taking advantage of these routes also simultaneously enriches our economy Digging deeply into issues like these is the book's main aim Helping teenagers think through what they want to do with their lives occupationally is its main educational mission Recognizing the economic and other dangers posed by severe skill gaps made worse by the retirement of skilled baby boomers adds urgency to the mix

**Variability in Human Performance** Thomas J. Smith, Robert A. Henning, Michael G. Wade, Thomas Fisher, 2014-08-26 Understanding the conditions under which variability

in performance may arise and the processes related to its emergence gives us insight into the development of techniques for improving the quality of performance. Variability in Human Performance details the scientific and the practical implications of human performance variability by providing a broad perspective on how and why such variability occurs across a number of disciplinary domains. The text takes an approach that rests upon the idea of context or design specificity in performance namely that variability in performance is closely referenced to design factors in the environment in which performance is occurring. An exploration of the link between variability and related processes the book introduces a comprehensive framework for understanding human performance variability presented in terms of how human control of behavior is closely tied to design factors in the performance environment. The authors introduce empirical evidence as well as practical examples and application areas in support of this framework. The book begins with coverage of neurobiological and biomechanical basis of movement variability then examines rich and extensive empirical evidence available for context specificity in cognitive performance and learning as a basis for cognitive performance variability. The book then reviews the evidence for context specificity in Student learning, Displaced feedback conditions, Human error behavior, Affective performance, Social and team performance. The authors also explore work performance as influenced by complex sociotechnical systems and as a basis for performance variability applying control systems concepts to an interpretation of the nature and basis of performance variability in all of these domains. They conclude by taking an evolutionary perspective on the origins and behavioral significance of human performance variability. The book then provides strategies on how individuals, groups and organizations can significantly reduce variability in human performance that often leads to systems failures.

**Numerical Development - From cognitive functions to neural underpinnings** Korbini Moeller, Elise Klein, Klaus F Willmes - von Hinckeldey, Karin Kucian, 2015-02-24. Living at the beginning of the 21st century requires being numerate because numerical abilities are not only essential for life prospects of individuals but also for economic interests of post industrial knowledge societies. Thus numerical development is at the core of both individual as well as societal interests. There is the notion that we are already born with a very basic ability to deal with small numerosities. Yet this often called number sense seems to be very restricted, approximate and driven by perceptual constraints. During our numerical development in formal e.g. school but also informal contexts e.g. family street we acquire culturally developed abstract symbol systems to represent exact numerosities in particular number words and Arabic digits refining our numerical capabilities. In recent years numerical development has gained increasing research interest documented in a growing number of behavioural, neuro scientific, educational, cross cultural and neuropsychological studies addressing this issue. Additionally our understanding of how numerical competencies develop has also benefitted considerably from the advent of different neuro imaging techniques allowing for an evaluation of developmental changes in the human brain. In sum we are now starting to put together a more and more coherent picture of how numerical competencies develop and how this development is

associated with neural changes as well In the end this knowledge might also lead to a better understanding of the reasons for atypical numerical development which often has grievous consequences for those who suffer from developmental dyscalculia or mathematics learning disabilities Therefore this Research Topic deals with all aspects of numerical development findings from behavioural performance to underlying neural substrates from cross sectional to longitudinal evaluations from healthy to clinical populations To this end we included empirical contributions using different experimental methodologies but also theoretical contributions review articles or opinion papers
