

# Mitosis

How do living things grow and repair themselves?

## Why?

Living things must grow and develop. At times they suffer injuries or damage, or cells simply wear out. New cells must be formed for the organism to survive. What process must occur to make a new, properly-functioning cell?

## Model 1 – Mitosis as Part of the Cell Cycle

1. Refer to Model 1. List the four phases in the mitosis process.
2. Where is mitosis in the cell cycle? Before \_\_\_\_\_ and after \_\_\_\_\_.
3. What three phases of the cell cycle are considered **interphase**?
4. Refer to the cell cycle shown.
  - a. How many cells are present at the beginning of mitosis?
  - b. How many cells are present at the end of mitosis?

Mirsky, 2014-05-10 The Cell Biochemistry Physiology Morphology Volume III Meiosis and Mitosis covers chapters on meiosis and mitosis The book discusses meiosis with regard to the meiotic behavior of chromosomes the anomalous meiotic behavior in organisms with localized centromeres and in forms with nonlocalized centromeres and the nature of the synaptic force The text also describes the mechanism of crossing over the relationship of chiasmata to crossing over and metaphase pairing and the reductional versus equational disjunction The process of mitosis and the physiology of cell division are also considered The book further tackles the significance of cell division and chromosomes the essential mitotic plan and its variants the preparations for mitosis and the transition period The text also demonstrates the time course of mitosis the mobilization of the mitotic apparatus metaphase the metaphase the mitotic apparatus anaphase telophase cytokinesis and the physiology of the dividing cell Physiological reproduction mitotic rhythms and experimental synchronization and the blockage and stimulation of division are also encompassed Biologists microbiologists zoologists and botanists will find the book invaluable      **Mitosis Facts and Questions** M. Little, N. Paweletz, C. Petzelt, H. Ponstingl, D. Schroeter, H.-P. Administrative Editor: Zimmermann, V. Runnström-Reio, 2012-12-06 Two years ago about twenty people gathered informally in our institute to discuss mitosis We took this opportunity to try to separate the hard facts of mitosis which are accepted by most people from the soft ones which are still open for discussion Surprisingly few hard facts survived with their reputation still intact This result led us to organize a similar meeting on a larger scale The outcome was the workshop Mitosis Facts and Questions which was held at the German Cancer Research Center in Heidelberg from April 25-29 1977 An introductory lecture was given for each of nine major topics followed by an extensive discussion of facts questions and future experiments Further details were provided by posters The proceedings of the meeting are published in this volume We feel that many open questions and facts described here will provide stimulating ideas and a basis for further investigation of this fundamental process The success of the workshop would not have been possible without the help of many people We are very grateful to the German Cancer Research Center for its interest and assistance and for the support of the Verein zur Förderung der Krebsforschung in Deutschland represented by Prof Dr h c K H Bauer the ECBO European Cell Biology Organization and the Deutsche Gesellschaft für Zellbiologie Our sincere thanks are also extended to our students and technicians for their enthusiastic help and to Mrs Joa for typing the manuscripts      **Mitosis** Andrew D. Structure The actuality of structural elements in the spindle Nature and origin of the spindle apparatus Hypotheses of mitosis Related problems Conclusion Optical Studies on Cell Division (Mitosis) Norman Miyamoto Baker, 2010 Mitosis is the process by which cells after having duplicated their DNA content segregate chromosomes equally into two identical daughter cells Mitosis is a very short part of a normal cell cycle usually 24 hours and ranges from 30 minutes to an hour depending on cell type and environmental conditions During this incredibly short amount of time the cell undergoes several complex re arrangements biomechanically and biochemically Microtubules 20 nm width dimer polymers play an essential role as the building blocks that provides the cytoskeleton and mitotic spindle for the cell provide the force that segregates chromosomes anaphase to satisfaction of tension and attachment based checkpoints metaphase anaphase transition To elucidate the key role microtubules have in mitosis drugs such as taxol and nocodazole have been used to impart catastrophic global damage to the mitotic spindle and study the effects on cellular division However catastrophic global damage can not answer specific questions regarding highly spatially localized damage and temporally transient damage In elucidating the role of microtubules chromosomes and other key biological structures there is the need for a transient perturbation on the mitotic process To study the effects of transient perturbation on mitosis a Laser microscope system Robolase was developed to deliver spatially localized 0.4  $\mu\text{m}$  and temporally specific disruption inside living cells nanosurgery Specifically the affect of

ablating chromosome tips mitotic spindles and chromatid are examined and the relationship between damaged sites and pathways controlling the progression of the cell cycle and DNA damage pathways are examined In conclusion an optically based method for studying mitosis with transient perturbation has been developed and used to determine that chromosome tip disruption affects cytokinetic progression prolonged disruption of mitotic spindle reveals force sensing in the metaphase spindle and double strand breaks of DNA recruit CENP A in addition to known DNA damage proteins      Looking at Chromosomes John McLeish, Brian Snodgrass, 1959
