When an "elementary" actor of that generation first encountered the work of the composer, it was the performance possibilities of the instrument that attracted him. This changed with age and with study, and it is possible that the young Stravinsky, at least in the early 1920s, had some doubts about whether he could become the composer of the future. He was, however, a composer, and he was not going to let his doubts stand in the way of his work.

It could have been a better strategy, among others, to not over-invest in the IT system. This was probably an ill-considered assumption when the business model started to come along. In particular, why? The main point was that the business plan, which is a strategy for your business, is ultimately an economic proposition. Therefore, a business plan should be based on a realistic assessment of the costs of the IT system.

1. Explain the difference between a variable and a constant.
 A variable is a value that can change, while a constant is a value that remains the same.
 2. What is the difference between a scalar and a vector?
 A scalar is a quantity that has only magnitude, while a vector has both magnitude and direction.
 3. Define the term "displacement" and give an example.
 Displacement is the change in position of an object. For example, if you walk 5 meters north, your displacement is 5 meters north.
 4. What is the difference between distance and displacement?
 Distance is the total length of the path traveled, while displacement is the straight-line distance from the starting point to the ending point.
 5. Explain the concept of "average velocity" and how it is calculated.
 Average velocity is the total displacement divided by the total time taken. It is calculated as: $\text{Average Velocity} = \frac{\text{Total Displacement}}{\text{Total Time}}$
 6. What is the difference between speed and velocity?
 Speed is a scalar quantity that measures how fast an object is moving, while velocity is a vector quantity that measures both the speed and direction of motion.
 7. Define the term "acceleration" and give an example.
 Acceleration is the rate of change of velocity. For example, if a car starts from rest and reaches a speed of 60 km/h in 10 seconds, its acceleration is 6 m/s².
 8. What is the difference between uniform and non-uniform motion?
 Uniform motion is motion with a constant velocity, while non-uniform motion is motion with a changing velocity.
 9. Explain the concept of "free fall" and how it is related to acceleration.
 Free fall is the motion of an object under the influence of gravity alone. It is related to acceleration because the acceleration due to gravity is constant and acts downwards.
 10. What is the difference between a projectile and a satellite?
 A projectile is an object that is launched into the air and follows a parabolic path. A satellite is an object that orbits a planet or other celestial body.
