Epperlein,1984 Photosensitive Material for Silver Halide Photography K. Yoshida,Y. Usakawa,N. Harukawa,Konika Co,1989 *Embedded Silver Nanoparticles for Metal Enhanced Photoluminescence* Shahid Iqbal (Ph. D.),2019 Imaging of biologically significant molecules using plasmons of Metal Nanoparticles MNPs is gaining attention in the research community Localized Surface Plasmon Resonance LSPR is the coherent oscillation of conduction electrons of MNPs The biologically significant molecule is labeled with the fluorophore molecule to get the image This approach is widely used in clinical practices however low intensity light emission from the labeled molecule makes it difficult to image the biologically significant material One way to improve the weak intensities of fluorophore is to enhance the brightness using a process called Metal Enhanced Photoluminescence MEP This phenomenon occurs in the close vicinity of MNPs Most of the studies in this regard have been carried out using chemically synthesized MNPs of different crystallinity sizes and shapes One problem with this approach is the possibility of direct chemical interaction between the fluorophore and MNPs that results in quenching of the Photoluminescence PL intensity In this dissertation we adopted the approach to enhance the PL of different fluorophore molecules materials by exploiting the LSPR of embedded noble MNPs Noble MNPs Au Ag Cu are widely used because the LSPR resonant frequency falls in the visible region of the electromagnetic spectrum that closely overlaps with the excitation frequency of the fluorophore that are used for biological imaging We tested our approach using Coumarin C 515 dye and lead halide perovskites CsPbX₃ X Cl Br and I and successfully enhanced PL intensity Moreover lead halide perovskites have several optoelectronics applications that make them fluorophore of interest In this dissertation embedded Silver Nanoparticles Ag NPs were synthesized via low energy ion implantation within a few nanometers below the surface of quartz substrates Ion implantation was carried out with different ion beam fluences and 70 keV ion beam energy Rutherford Backscattering Spectrometry RBS measurements were used to obtain the depth profile and concentration of silver within the quartz substrate The formation of Ag NPs is characterized by UV Visible spectroscopy measurements LSPR peaks of Ag NPs were observed with respect to different fluences that

confirmed the formation of embedded Ag NPs. An increase in the size distribution of Ag NPs was observed as the fluence of Ag within the substrate increased. Size increase of Ag NPs was confirmed by the broadening as well as the red shift of LSPR peaks. Steady state excitation and emission measurements of C 515 CsPbI₃ CsPbBr₂ and CsPbBr₃ were carried out to see the effect of embedded Ag NPs on the PL properties of fluorophores. An increase in the PL intensity of C 515 CsPbI₃ and CsPbBr₂ was observed with the increase in fluences giving maxima of 2, 1, 3, 6 and 5, 9 times the PL intensity enhancement. The observed PL enhancement was attributed to a combination of plasmon enhancement with larger Ag NPs and increased plasmonic hot spots. In addition, PL quenching was also observed in case of the CsPbBr₃ perovskite nanocomposites with the quenching corresponding to the non radiative energy transfer from CsPbBr₃ perovskite to silver nanoparticles.

Iijima, Konika K.K., 1989. **Plasmonic Field Effects of Silver Nanoparticle Monolayers on Poly(phenylene Ethynylene) Fluorescent Polymers of Different Chain Length** Adam James Poncheri, 2011. The literature on nanomaterials has been flooded with new shapes, sizes and compositions of nanostructures. The process of developing and characterizing these particles has been broadly accomplished and many interesting and promising properties have been revealed for application in current and developing technologies. In particular, the phenomenon of surface plasmon resonance seen in metallic gold and silver nanoparticles has drawn substantial interest. It has been established that the electromagnetic fields surrounding plasmonic particle surfaces can influence the properties of nearby systems causing them to experience effects such as enhanced absorption and emission of light or drastically increased conductivity. For this reason

plasmonic nanoparticles are being applied to an endless number of applications for new materials This thesis investigated the effects of silver nanocube AgNC arrays on the photophysical properties of poly paraphenyleneethynylene PPE fluorescent polymers a particularly relevant material to the applications of organic electronics AgNCs were selected because of their particularly strong plasmonic field which is enhanced at the sharp features of the cubes The PPE polymer is an exceptionally fluorescent conjugated polymer that often serves as a building block for polymer based sensing applications By monitoring the absorption and emission of the PPE polymer a better understanding of plasmonic effects on this polymer system was obtained Compression of the monolayer of AgNCs on the surface of a Langmuir Blodgett trough can be used for control of interparticle distance and thus the plasmon field intensity felt by an adsorbed layer of PPE polymer Photosensitive Material for Silver Halide Photography with Diminished Pressure Fogging Y.
