Artificial Ventilation David J. Baker, 2016-08-23 This book provides a basic clinical guide to the principles and practice of artificial ventilation both manual and mechanical. It covers the development of artificial ventilation through the ages and the essential anatomy and physiology behind it. While there are many detailed texts available on mechanical ventilation they are usually aimed at the hospital specialist and cover the many complex modes of ventilation used in the hospital setting. This book covers the basics of airway and ventilation management for non specialists working in pre hospital and emergency medicine. It fulfils the need for a resource that explains simply and clearly basic respiratory physiology, the pathophysiology behind respiratory failure and the practical aspects of artificial ventilation. This book links the two areas of hospital and pre hospital practice together to promote better understanding of artificial ventilation by medical, paramedical and nursing personnel working in different fields of medicine.

Emerging Technologies for Nutrition Research Institute of Medicine, Committee on Military Nutrition Research, 1997-10-03 The latest of a series of publications based on workshops sponsored by the Committee on Military Nutrition Research this book's focus on emerging technologies for nutrition research arose from a concern among scientists at the U S Army Research Institute of Environmental Medicine that traditional nutrition research using standard techniques centered more on complex issues of the maintenance or enhancement of performance and might not be sufficiently substantive either to measure changes in performance or to predict the effects on performance of stresses soldiers commonly experience in operational environments The committee's task was to identify and evaluate new technologies to determine whether they could help resolve important issues in military nutrition research The

book contains the committee's summary and recommendations as well as individually authored chapters based on presentations at a 1995 workshop. Other chapters cover techniques of body composition assessment, tracer techniques for the study of metabolism, ambulatory techniques for the determination of energy expenditure, molecular and cellular approaches to nutrition, the assessment of immune function, and functional and behavioral measures of nutritional status.
