*Mobile Security: How to secure, privatize and recover your devices* Timothy Speed, Darla Nykamp, Joseph Anderson, Jaya Nampalli, Mari Heiser, 2013-09-10 Learn how to keep yourself safe online with easy to follow examples and real life scenarios Written by developers at IBM this guide should be the only resource you need to keep your personal information private Mobile security is one of the most talked about areas in I T today with data being stolen from smartphones and tablets around the world Make sure you and your family are protected when they go online **Learning AirWatch** Mark Dunkerley, 2015-03-31 If you are a technical professional who wants to dive deeper into the functionality offered by AirWatch or manage the solution then this book will help you choose the best set of configuration device management and monitoring options that you can use to effectively manage your EMM implementation Learning iOS Security Allister Banks, Charles S. Edge, 2015-02-27 This book is intended for mobile security professionals who want to learn how to secure iOS operating systems and its applications Any knowledge of iOS architecture would be an added advantage Learning Puppet Security Jason Slagle, 2015-03-27 If you are a security professional whose workload is increasing or a Puppet professional looking to increase your knowledge of security or even an experienced systems administrator then this book is for you This book will take you to the next level of security automation using Puppet The book requires no prior knowledge of Puppet to get started

*Mobile Device Security For Dummies* Rich Campagna, Subbu Iyer, Ashwin Krishnan, 2011-08-09 Factor mobile devices into the IT equation and learn to work securely in this smart new world Learn how to lock down those mobile devices so that doing business on the go doesn't do you in **Security and Privacy for Ubiquitous Mobile Devices** Edmund Novak, 2016 We live in a world where mobile devices are already ubiquitous It is estimated that in the United States approximately two thirds of adults own a smartphone and that for many these devices are their primary method of accessing the Internet World wide it is estimated that in May of 2014 there were 6.9 billion mobile cellular subscriptions almost as much as the world population Of these 6.9 billion approximately 1 billion are smart devices which are concentrated in the developed world In the developing world users are moving from feature phones to smart devices as a result of lower prices and marketing efforts Because smart mobile devices are ubiquitous security and privacy are primary concerns Threats such as mobile malware are already substantial with over 2500 different types identified in 2010 alone It is likely that as the smart device market continues to grow so will concerns about privacy security and malicious software This is especially true because these mobile devices are relatively new Our research focuses on increasing the security and privacy of user data on smart mobile devices We propose three applications in this domain 1 a service that provides private mobile location sharing 2 a secure intuitive proximity networking solution and 3 a potential attack vector in mobile devices which utilizes novel covert channels We also propose a first step defense mechanism against these covert channels Our first project is the design and implementation of a service which provides users with private and secure location sharing This is useful for a variety of

applications such as online dating taxi cab services and social networking Our service allows users to share their location with one another with trust and location based access controls We allow users to identify if they are within a certain distance of one another without either party revealing their location to one another or any third party We design this service to be practical and efficient requiring no changes to the cellular infrastructure and no explicit encryption key management for the users For our second application we build a modem which enables users to share relatively small pieces of information with those that are near by also known as proximity based networking Currently there are several mediums which can be used to achieve proximity networking such as NFC bluetooth and WiFi direct Unfortunately these currently available schemes suffer from a variety of drawbacks including slow adoption by mobile device hardware manufactures relatively poor usability and wide range omni directional propagation We propose a new scheme which utilizes ultrasonic high frequency audio on typical smart mobile devices as a method of communication between proximal devices Because mobile devices already carry the necessary hardware for ultrasound adoption is much easier Additionally ultrasound has a limited and highly intuitive propagation pattern because it is highly directional and can be easily controlled using the volume controls on the devices Our ultrasound modem is fast achieving several thousand bits per second throughput non intrusive because it is inaudible and secure requiring attackers with normal hardware to be less than or equal to the distance between the sender and receiver a few centimeters in our tests Our third work exposes a novel attack vector utilizing physical media covert channels on smart devices in conjunction with privilege escalation and confused deputy attacks This ultimately results in information leakage attacks which allow the attacker to gain access to sensitive information stored on a user s smart mobile device such as their location passwords emails SMS messages and more Our attack uses our novel physical media covert channels to launder sensitive information thereby circumventing state of the art taint tracking analysis based defenses and at the same time the current widely deployed permission systems employed by mobile operating systems We propose and implement a variety of physical media covert channels which demonstrate different strengths such as high speed low error rate and stealth By proposing several different channels we make defense of such an attack much more difficult Despite the challenging situation in this work we also propose a novel defense technique as a first step towards research on more robust approaches As a contribution to the field we present these three systems which together enrich the smart mobile experience while providing mobile security and keeping privacy in mind Our third approach specifically presents a unique attack which has not been seen in the wild in an effort to keep ahead of malicious efforts
