Mobile Agents Niranjana Suri, 2003-06-30 Welcome to the proceedings of the 6th IEEE International Conference on Mobile Agents MA 2002 took place in Barcelona Spain and was co located with the 4th International Workshop on Mobile Agents for Telecommunications Applications Both events were held at the Universitat Pompeu Fabra October 22-25 2002 Mobile agents may be defined as programs that with varying degree of autonomy can move between hosts across a network Mobile agents combine the notions of mobile code mobile computation and mobile state Capabilities of mobile agents include Supporting unreliable networks and disconnected operation Counteracting low bandwidth high latency communication links Deploying new behaviour through mobile code and reconfiguring systems on the fly Distributing processing load across systems Improving survivability in the face of network and system failure Given the above capabilities mobile agents while they may not be referred to as such are now becoming accepted as a fundamental architectural construct for the design and development of complex adaptive systems that need to operate in highly dynamic environments Mobile agents also support applications in several domains such as ubiquitous computing grid computing remote sensing data mining system management and agile computing

Mobile Agents Gian P. Picco, 2003-06-30 Recent years have witnessed the appearance of new paradigms for designing distributed applications where the application components can be relocated dynamically across the hosts of the network This form of code mobility lays the foundation for a new generation of technologies architectures models and applications in which the location at which the code is executed comes under the control of the designer rather than simply being a configuration accident Among the various flavors of mobile code the mobile agent paradigm has become particularly popular Mobile agents are programs able to determine autonomously their own migration to a different host and still retain their

code and state or at least a portion thereof Thus distributed computations do not necessarily unfold as a sequence of requests and replies between clients and mote servers rather they encompass one or more visits of one or more mobile agents to the nodes involved Mobile code and mobile agents hold the potential to shape the next generation of technologies and models for distributed computation The first steps of this process are already evident today Web applets provide a case for the least sophisticated form of mobile code Java based distributed middleware makes increasing use of mobile code and the first commercial applications using mobile agents are starting to appear

Information Logistics. Decentralized

Approaches of Information Allocation in Information Exchange Networks Sven Grolik, 2012-02-24 The use of modern planning and optimization systems for process synchronization in value networks requires the optimal information exchange between the entities involved The central focus of Sven Grolik's study is the development of efficient mechanisms for the coordination of information allocation by the example of interconnected transportation marketplaces Unlike traditional information allocation algorithms the algorithms developed in his analysis are based on update mechanisms which maintain a weak consistency of replicated information in the network Sven Grolik shows that these algorithms enable savings concerning the update costs as well as increase the performance within the network but at the same time guarantee compliance with quality of service levels concerning the currency of information The focus of this work is the development of decentralized online algorithms which make a logically distributed computation possible on the basis of local information The development of these innovative algorithms is based on approaches of multi agent system theory as well as distributed simulated annealing techniques

Developments in Applied Artificial Intelligence

Tim Hendtlass, Moonis Ali, 2003-08-02 Artificial Intelligence is a field with a long history which is still very much active and developing today Developments of new and improved techniques together with the ever increasing levels of available computing resources are fueling an increasing spread of AI applications These applications as well as providing the economic rationale for the research also provide the impetus to further improve the performance of our techniques This further improvement today is most likely to come from an understanding of the ways our systems work and therefore of their limitations rather than from ideas borrowed from biology From this understanding comes improvement from improvement comes further application from further application comes the opportunity to further understand the limitations and so the cycle repeats itself indefinitely In this volume are papers on a wide range of topics some describe applications that are only possible as a result of recent developments others describe new developments only just being moved into practical application All the papers reflect the way this field continues to drive forward This conference is the 15th in an unbroken series of annual conferences on Industrial and Engineering Application of Artificial Intelligence and Expert Systems organized under the auspices of the International Society of Applied Intelligence

Networks

Kurt Geihs, Wolfgang König, Falk von Westarp, 2012-12-06 New information and communication technologies unquestionably brought about enormous changes that resulted in an ever increasing networked

society Indeed there is no area in the social and economic world which is unaffected by the recent advances In response to these changes scientists from numerous disciplines teamed up in 1997 to lay a foundation for a common theory of networks The objective was to gain a deeper understanding of the mechanisms behind social economic technical and other kinds of networks in order to develop a unified theory of networks Such a theory would then guide public and private decisions concerning the planning operations and controlling of all kinds of networks The contributions in this book represent the first steps toward this ambitious goal
