Model Systems In Aging Topics In Current Genetics Vol 3:

Model Systems in Aging Thomas Nyström, Heinz D. Osiewacz, 2004 Aging is the progressive decline in biological functions over time This decline targets macromolecules cells tissues and as a consequence whole organisms Despite considerable progress in the development of testable hypothesis concerning aging in an evolutionary context a unifying theory of the molecular physiological mechanistic causes of aging has not been reached In fact is it not clear to what extent aging is a programmed or stochastic process This book takes the reader from unicellular bacterial deterioration via senescence in fungi and worms to aging in rodents and humans allowing a comparative view on similarities and differences in different genetic model systems The different model systems are scrutinized in the light of contemporary aging hypothesis such as the free radical and genomic instability theories Evolutionary Interpretations of Aging, Disease Phenomenon, and Sex Giacinto Libertini, 2011 **Aging Research in Yeast** Michael Breitenbach, S. Michal Jazwinski, Peter Laun, 2011-11-19 This volume includes contributions by the leading experts in the field of yeast aging Budding yeast *Saccharomyces cerevisiae* and other fungal organisms provide models for aging research that are relevant to organismic aging and to the aging processes occurring in the human body Replicative aging in which only the mother cell ages while the daughter cell resets the clock to zero is a model for the aging of stem cell populations in humans while chronological aging measured by survival in stationary phase is a model for the aging processes in postmitotic cells for instance neurons of the brain Most mechanisms of aging are studied in yeast Among them this book discusses mitochondrial theories of aging emphasizing oxidative stress and retrograde responses the role of autophagy and mitophagy the relationship of apoptosis to aging processes the role of asymmetric segregation of damage in replicative aging the role of replication stress and the role of the cytoskeleton in aging Modern methods of yeast genetics and genomics are described that can be used to search for aging specific functions in a genome wide unbiased fashion The similarities in the pathology of senescence studied in yeast and of cancer cells including genome instability are examined **The Essential Revolution of Evolutionary Medicine** Giacinto Libertini, Graziamaria Corbi, Olga Shubernetskaya, Klara Komici, Nicola Ferrara, 2025-02-24 This book proposes a way to radically renew medicine by extending to medicine the concepts of evolutionary biology The book considers diseases not as unpredictable harmful events but as logical consequences of evolutionary mechanisms In particular a large part of the most widespread diseases that afflict modern populations are interpreted as the consequence of discordances mismatches between new living conditions and the adaptation of our species It discusses the basic concepts as well as diseases deriving from alterations of the genotype and general concepts about diseases deriving from alterations of the ecological niche It also describes diseases deriving from relations with other living beings especially when the ecological niche is altered diseases deriving from conditions beyond the adaptation range and physiological phenomena that cause troubles and suffering or even death A particular study is dedicated to the interpretation of aging and its consequences in normal or altered conditions of the ecological niche The final

part of the book describes the implementation of evolutionary medicine This book complementing the Evolutionary Gerontology and Geriatrics book which is also published in this series provides a valuable read for scholars and students in the fields of medicine evolutionary biology preventive medicine and gerontology

Evolutionary Gerontology and Geriatrics Giacinto Libertini, Graziamaria Corbi, Valeria Conti, Olga Shubernetskaya, Nicola Ferrara, 2021-05-25 This book provides concrete scientific basis that we can conceive the possibility of modifying or even completely canceling aging process despite the fact that aging is commonly regarded as the result of the overall effects of many uncontrollable degenerative phenomena The authors illustrate in detail the mechanisms by which cells and the whole organism age Actions by which it is possible or will be possible within a limited time to operate for modifying aging are also debated The discussion is conducted within the frame and the concepts of evolutionary medicine which is also indispensable for distinguishing between the manifestations of aging and i diseases that worsen with age and ii acceleration of normal aging rates caused by unhealthy lifestyle habits and other avoidable factors The book also discusses the impact of aging on overall mortality and the strange situation that according to official statistics aging does not exist as cause of death This book is a turning point between a gerontology and geriatrics conceived as the study and vain treatment of an incurable condition and one in which these disciplines examine the how and why of a physiological phenomenon that can be modified up to a possible total control This means transforming the medical prevention and treatment of physiological aging from the greatest failure to the greatest success of medicine

Evolution from Cellular to Social Scales Arne T. Skjeltorp, Alexander V. Belushkin, 2008-09-26 Evolution is a critical challenge for many areas of science technology and development of society The book reviews general evolutionary facts such as origin of life and evolution of the genome and clues to evolution through simple systems Emerging areas of science such as systems biology and bio complexity are founded on the idea that phenomena need to be understood in the context of highly interactive processes operating at different levels and on different scales This is where physics meets complexity in nature and where we must begin to learn about complexity if we are to understand it Similarly there is an increasingly urgent need to understand and predict the evolutionary behavior of highly interacting man made systems in areas such as communications and transport which permeate the modern world The same applies to the evolution of human networks such as social political and financial systems where technology has tended to vastly increase both the complexity and speed of interaction which is sometimes effectively instantaneous The book contains reviews on such diverse areas as evolution experiments with microorganisms the origin and evolution of viruses evolutionary dynamics of genes and environment in cancer development aging as an evolution facilitating program evolution of vision and evolution of financial markets

Cancer Models Michael Breitenbach, Jens Hoffmann, 2019-02-05 Cancer research like research on other diseases highly depends on representative and reliable model systems In the Research Topic Cancer Models we collected original papers and review articles addressing the topic of tumor modeling from molecular biology biochemistry microorganisms cells and organoids fishes animals and xenografts up to computational cancer models and patient data analysis This representative eBook describes that there is not a single molecular defined tumor but rather a heterogenic and highly variable complex of different individual diseases This is what makes research on cancer so difficult expensive and explains the broad number of models needed for research Our authors describe new next generation sequencing based methods to analyze complex patterns of chromosomal aberrations in order to understand the molecular biology of tumorigenesis as well as the role of cellular senescence and dormancy in the aetiology of tumor formation and development of therapy resistance of tumors The current developments on 3D cultures are thoroughly reviewed as these models help to overcome the current limitations of cell cultures and allow a more accurate mimicry of the native cancer tissue including cellular heterogeneity and restore specific biochemical and morphological Reviews about tumor models in zebrafish different transgenic mouse strains and pigs conclude the book In the final two chapters of this volume the authors discuss the theoretical and mathematical models developed in cancer research **The Thymus in Health and Senescence** Nathan F.
