Modelling The Economy:

Economic Model Building Frank Neal, Sir Robert Minshull Shone, 1976 Textbook on the theoretics and methodology of economic model construction discusses the use of the scientific method and creative thinking in the construction of dynamic models incl Economic policy models and econometrics models etc One page bibliography

A History of Macroeconometric Model-building Ronald G. Bodkin, Lawrence Robert Klein, Kanta Marwah, 1991 This major book presents for the first time an authoritative history of developments in macroeconometric modelling since the 1930s It focuses in particular on the construction of mathematical statistical models of entire economies estimated from national accounts and other macroeconomic data International and comparative in scope the book contains chapters prepared by specialists from the different countries concerned This landmark book is indispensable to an understanding of the history and development of large scale econometric models of modern economies

Modeling Dynamic Economic Systems Matthias Ruth, Bruce Hannon, 2012-12-06 The frontiers of physical science and technology commanded attention during the last two centuries In the next century lies the frontier of better understanding of the behavior of social and economic systems Ruth and Hannon join many other pioneers exploring this new frontier By building on the profession of system dynamics Ruth and Hannon contribute to movement away from purely mental models which necessarily lack adequate precision toward more insightful and disciplined computer simulation models The STELLA software used in this book is one of several computer applications created to implement the concepts of system dynamics a discipline that has been developed over the last 40 years and now extends into many fields of activity System dynamics is beginning even in kindergarten through 12th grade education to provide a rigorous foundation for dealing with dynamic change in mathematics physics social studies environment history and even literature Education at every level will be changing from teaching isolated facts to allowing students to explore those systems within which facts policies and individual relationships are embedded to develop their ability to think in terms of dynamic systems This book includes elementary instruction in system dynamics modeling and in the STELLA software It covers a wide range of material from simple building blocks of systems to models and mathematics of considerable complexity The material opens many avenues for further exploration refinement and simplification

Mathematical Modeling in Economics, Ecology and the Environment Natali Hritonenko, Yuri Yatsenko, 2014-01-08 Updated to textbook form by popular demand this second edition discusses diverse mathematical models used in economics ecology and the environmental sciences with emphasis on control and optimization It is intended for graduate and upper undergraduate course use however applied mathematicians industry practitioners and a vast number of interdisciplinary academics will find the presentation highly useful Core topics of this text are Economic growth and technological development Population dynamics and human impact on the environment Resource extraction and scarcity Air and water contamination Rational management of the economy and environment Climate change and global dynamics The step by step approach taken is

problem based and easy to follow The authors aptly demonstrate that the same models may be used to describe different economic and environmental processes and that similar investigation techniques are applicable to analyze various models Instructors will appreciate the substantial flexibility that this text allows while designing their own syllabus Chapters are essentially self contained and may be covered in full in part and in any order Appropriate one and two semester courses include but are not limited to Applied Mathematical Modeling Mathematical Methods in Economics and Environment Models of Biological Systems Applied Optimization Models and Environmental Models Prerequisites for the courses are Calculus and preferably Differential Equations

The Craft of Economic Modeling Clopper Almon, 2017-07 This book is a practical guide to building economic models both macroeconomic and multisectoral It uses free software available from the Internet together with regularly updated databanks including the quarterly national accounts of the United States and other quarterly data It assumes no prior acquaintance with econometrics or computer programming but does assume a willingness to follow a mathematical argument Much of the text has often been used in college teaching The book begins with a very simple model that can be computed with a hand calculator or cell phone The model has however a nonlinearity in the investment function and shows how a nonlinearity can lead to a model with a cycle which neither damps out nor explodes It then moves to models built with real data in the framework of the U S National Income and Product Accounts and develops the important concept of identity centered modeling Once the identities are working properly the modeler can proceed to the estimation of equations by least squares regressions Gradually the reader is led to the construction of a model roughly comparable to those used by commercial economic forecasting firms At every step of the way the reader sees results of calculations with real data and is urged to estimate his or her own equations with real up to date data The second section explores making alternative forecasts with this model and devising optimal economic policies with its aid It also explores the range of uncertainty of the forecasts due to known variability of the errors in its equations A rather long chapter expounds some conventional econometric methods and applies them to real data to both illustrate them and evaluate their usefulness Although most of the book uses equations which are linear in the parameters which must be estimated some functions very useful for certain purposes in economics are non linear in the parameters A chapter is devoted to their estimation Most of the book uses the relatively simple U S system of national accounts but one chapter deals with modeling with the more complicated System of National Accounts used by most other countries Like the economy itself dynamic models such as those built here have a tendency to develop cycles One chapter looks into the mathematical theory of why that is so The third section enlarges the scope of the book to include multisectoral models Although here the model actually built is a tiny one of 8 sectors with made up data the methods employed are exactly those of the Inforum models used in a number of countries around the world Multisectoral models can use many of the same techniques used for macromodels but there are some additional problems One of these is the estimation of personal consumption functions where the demand for any one product depends not only on its

price but those of all other products One method which has worked better than others is explained and the results of its estimation in four countries are presented and compared Another problem is the computation of product to product tables from those constructed by statistical agencies The book does not explain Real Business Cycle models nor Computable General Equilibrium models nor Dynamic Stochastic General Equilibrium models which are all in the author's opinion unrealistic fads not serious ways of modeling an economy

The New Generation of Computable General Equilibrium Models Federico Perali, Pasquale Lucio Scandizzo, 2018-05-02 This book covers some important topics in the construction of computable general equilibrium CGE models and examines use of these models for the analysis of economic policies their properties and their implications Readers will find explanation and discussion of the theoretical structure and practical application of several model typologies including dynamic stochastic micro macro and simulation models as well as different closure rules and policy experiments The presentation of applications to various country and problem specific case studies serves to provide an informed and clearly articulated summary of the state of the art and the most important methodological advancements in the field of policy modeling within the framework of general equilibrium analysis The book is an outcome of a recent workshop of the Italian Development Economists Association attended by a group of leading practitioners involved in the generation of CGE models and research on modeling the economy and policy making It will be of interest to researchers professional economists graduate students and knowledgeable policy makers

Economic Models for Policy Making Solomon Cohen, 2013-05-02 Over the past decades many different kinds of models have been developed that have been of use to policy makers but until now the different approaches have not been brought together with a view to enhancing the systematic unification and evaluation of these models This new volume aims to fill this gap by bringing together four decades worth of work by S I Cohen on economic modelling for policy making Work on older models has been rewritten and brought fully up to date and these older models have therefore been brought back to the fore both to assess how they influenced more recent models and to see how they could be used today The focus of the book is on models for development policies in developing economies but there are some chapters that relate to economic policies in transition and developed economies The policy areas covered are of typical interest in developing and transition economies They include those relating to trade liberalization reforms sustainable development industrial development agrarian reform growth and distribution human resource development and education public goods and income transfers Each chapter contains a brief assessment of the empirical literature on the economic effects of the policy measures discussed in the chapter The book presents a platform of economic modelling that can serve as a refresher for practising professionals as well as a reference companion for graduates engaging in economic modelling and policy preparations

HERMES: Harmonised Econometric Research for Modelling Economic Systems Commission of the European Commission of the European Com, 2014-06-28 The HERMES European system of models is featured in this book This system was set up at the initiative of the Commission of

the European Communities Directorate General for Science Research and Development It involves a series of medium term macrosectoral econometric models in which energy plays a special role as a production factor The different models are interlinked by a bilateral flow module which describes for each product the trade between all the Community countries taken in twos The United States Japan and five zones are represented in this by simplified versions of the Commission s COMET model This volume will help the reader to understand and interpret the numerous studies which have been undertaken with the help of the HERMES system Economists and researchers will find valuable information and figures with a common nomenclature on the economies of the different countries both on structural data and on economic operators

Behind the Model Peter Spiegler, 2015-09-03 This book looks behind the model to show how formal models of the economy work and why they sometimes fail

Economic Models Dipak R. Basu, 2009 Model Building is the most fruitful area of economics designed to solve real world problems using all available methods such as mathematical computational and analytical without distinction Wherever necessary we should not be reluctant to develop new techniques whether mathematical or computational That is the philosophy of this volume The volume is divided into three distinct parts Methods Theory and Applications The Methods section is in turn subdivided into Mathematical Programming and Econometrics and Adaptive Control System which are widely used in econometric analysis The impacts of fiscal policy in a regime with independent monetary authority and dynamic models of environmental taxation are considered In the section on Modelling Business Organization a model of a Japanese organization is presented Furthermore a model suitable for an efficient budget management of a health service unit by applying goal programming method is analyzed taking into account various socio economic factors This is followed by a section on Modelling National Economies in which macroeconomic models for the EU member countries are analyzed to find instruments that stabilize inflation with coordinated action

Modelling Economic Systems Alan Gully, 1996 This book will enable students to use a computer as a tool to analyse model and solve economic and business problems The book will develop an understanding of the methods and problems involved in the design and construction of computer based models of economic systems explain the features and use of a spreadsheet package focusing on Quattro Pro for Windows and critically examine the design construction and use of spreadsheet based models in several areas of economics and business The book integrates material by concentrating on practical issues of model building and problem solving and illustrates the use of spreadsheet software throughout Case studies and examples can be worked through on screen once the underlying theory has been assimilated

Regional Economic Modeling: A Systematic Approach to Economic Forecasting and Policy Analysis G.I. Treyz, 2013-11-11 Regional economic models are the key to predicting the effects of transportation economic development energy fiscal and environmental policies Despite this the principal regional economic policy analysis model used throughout the United States by government agencies universities and the private sector has not been presented in a book until now The approach to building understanding and using regional models

presented in Regional Economic Models A Systematic Approach to Forecasting and Policy Analysis is progressive It begins with the simplest possible models and concludes with a full presentation of the leading model used by policy makers today The full details are presented along with facilitating software which is made available so that the reader can build a prototype model for any state or country and can perform policy simulations with full operational models for a sample area Policy studies are discussed that have been carried out with the model as well as the range of ways in which policies can be tested through policy simulations The necessary background is developed for understanding the ways in which models can be used to improve the basis upon which policies are evaluated as well as the sensitivity of the predicted effects to the model chosen for the analysis The presentation is multifaceted and includes equations diagrams and numerical examples The professional literature is integrated with introductory materials to produce the first comprehensive book on regional modeling that extends from economic base models to modeling advances that are currently being published in economic journals

Modelling the Economy and the Environment Bjarne Madsen,Chris Jensen-Butler,Jorgen Birk Mortensen,Anne M. Bruun Christensen,2012-02-14 This book is based upon contributions to a Scandinavian conference on Transport Agriculture and the Environment in a Regional and National Development Perspective Quantitative and Modelling Approaches organised by AKF the Institute of Local Government Studies Denmark which was held on the Danish island of Bornholm in December 1993 The chapters represent leading edge research in Scandinavia at the end of 1993 into modelling relationships between the economy and the environment embracing both regional and sectoral perspectives The publication of this volume will hopefully contribute to dissemination of knowledge about the very active Scandinavian research tradition in this field a research tradition which is related to a long standing engagement of Scandinavian countries with environmental issues The contributors come from Denmark Norway and Sweden and the collection is prefaced by two chapters from well known Dutch researchers traditionally regarded by Scandinavians as close neighbours to the Scandinavian modelling tradition The support of SOM Society Economy and Environment an open research centre financed by the Danish Environmental Research Programme and of AKF in the organisation of the original conference and the preparation of this book is gratefully acknowledged It was with great sadness that the editors learned of the death of one of the contributors Poul Erik Stryg during the preparation of the book

Agent-based Models of the Economy R. Boero,M. Morini,M. Sonnessa,P. Terna,2015-06-16 Agent based models are tools that provide researchers in economic fields with unprecedented analytical capabilities This book describes the power of agent based models along their methodology and it provides several examples of applications spanning from public policy evaluation to financial markets

Model Building in Economics Lawrence A. Boland,2014 Concern about the role and the limits of modeling has heightened after repeated questions were raised regarding the dependability and suitability of the models that were used in the run up to the 2008 financial crash In this book Lawrence Boland provides an overview of the practices of and the problems faced by model

builders to explain the nature of models the modeling process and the possibility for and nature of their testing In a reflective manner the author raises serious questions about the assumptions and judgments that model builders make in constructing models In making his case he examines the traditional microeconomics macroeconomics separation with regard to how theoretical models are built and used and how they interact paying particular attention to the use of equilibrium concepts in macroeconomic models and game theory and to the challenges involved in building empirical models testing models and using models to test theoretical explanations

Modelling Economic Series Clive William John Granger, 1990 This is a volume of readings for graduate students especially those taking courses in applied econometrics who need to learn how to evaluate the validity of present theories and techniques The aim of the text is to aid readers in the difficult task of actually constructing models The essays vary in the degree of technical sophistication used but each paper intends to provide students with a sound knowledge of the practical difficulties of model specification evaluation and interpretation as well as advice on tackling these difficulties

Feedback Economics Robert Y. Cavana, Brian C. Dangerfield, Oleg V. Pavlov, Michael J. Radzicki, I. David Wheat, 2021-06-27 This book approaches economic problems from a systems thinking and feedback perspective By introducing system dynamics methods including qualitative and quantitative techniques and computer simulation models the respective contributions apply feedback analysis and dynamic simulation modeling to important local national and global economics issues and concerns Topics covered include an introduction to macro modeling using a system dynamics framework a system dynamics translation of the Phillips machine a re examination of classical economic theories from a feedback perspective analyses of important social ecological and resource issues the development of a biophysical economics module for global modelling contributions to monetary and financial economics analyses of macroeconomic growth income distribution and alternative theories of well being and a re examination of scenario macro modeling The contributions also examine the philosophical differences between the economics and system dynamics communities in an effort to bridge existing gaps and compare methods Many models and other supporting information are provided as online supplementary files Consequently the book appeals to students and scholars in economics as well as to practitioners and policy analysts interested in using systems thinking and system dynamics modeling to understand and improve economic systems around the world Clearly there is much space for more collaboration between the advocates of post Keynesian economics and system dynamics More generally I would like to recommend this book to all scholars and practitioners interested in exploring the interface and synergies between economics system dynamics and feedback thinking Comments in the Foreword by Marc Lavoie Emeritus Professor University of Ottawa and University of Sorbonne Paris Nord
