

Worksheet 10 Answer Keys: Finding Order in Biodiversity

Place the information below in boxes that correspond to the sections (20)

1. Linnaean taxonomy is hierarchical, includes a series of increasingly specific steps, or categories, composed of hierarchical prefixes (kingdom, phylum, class, order, family, genus, species) ending with taxon names. (Linnaeus, 1758-1830; Binomial nomenclature)
2. The domain is the most general taxon, subdividing the greatest number of species. The next category is phylum, and then class, order, and family. The species is the most specific name and refers to a group of similar organisms that can interbreed and produce fertile offspring.
3. The genus includes all those and includes species having a few basic, shared, and distinct traits. All of the traits shared among members of a genus are called synapomorphies. Each species is defined by its own set of traits, and their phylogenetic relationships slightly differing from one another.
4. A kingdom includes several phyla; eukaryotes are eukaryotes and prokaryotes are prokaryotes. For example, the animal kingdom includes a wide range of animals, and the plant kingdom includes all the plants and mushrooms in the eukaryotic domain is composed of the animal kingdom.
5. Hierarchical knowledge was developed, subdividing nature into a single system that not only was categorizing the organisms among themselves, but also was not only categorizing the organisms and themselves. Hierarchical knowledge is the relationship between the organisms and the organisms themselves. The organisms are not only categorizing the organisms and themselves, but also are categorizing the organisms and themselves.
6. The three domains are defined by the differences in the organisms at the cellular level between the eukaryotes, prokaryotes, and eukaryotes. The eukaryotes are the organisms that have the most complex cells, and the prokaryotes are the organisms that have the simplest cells.

Origins of Biodiversity

Lindell Bromham, Marcel Cardillo, 2019 Origins of Biodiversity is a unique introduction to the fields of macroevolution and macroecology which explores the evolution and distribution of biodiversity across time space and lineages Using an enquiry led framework to encourage active learning and critical thinking each chapter is based around a case study to explore concepts and research methods from contemporary macroevolution and macroecology The book focuses on the process of science as much as the biology itself to help students acquire the research skills and intellectual tools they need to understand and investigate the biological world around them In particular the emphasis on hypothesis testing encourages students to develop and test their own ideas This text builds upon the foundations offered in most general introductory evolutionary biology courses to introduce an exciting range of ideas and research tools for investigating patterns of biodiversity

Integrating Conservation Biology and Paleobiology to Manage Biodiversity and Ecosystems in a Changing World G. Lynn Wingard, Chris Schneider, Gregory P. Dietl, Damien Fordham, Policy makers and resource managers must make decisions that affect the resilience and sustainability of natural resources including biodiversity and ecosystem services However these decisions are often based on evidence or theory derived from highly altered systems and over short time periods of low magnitude environmental and climatic change Because natural systems change and evolve across multiple timescales from instantaneous to millennial long term understanding of how past life has responded to perturbations can inform resource managers By using these natural laboratories of the past conservation paleobiology and paleoecology provide the framework necessary to anticipate and plan for future changes The goal of this Research Topic is to heighten awareness among conservation and restoration practitioners to the value and applications of long term perspectives provided by conservation paleobiology and paleoecology Most conservation studies focus on systems already impacted by anthropogenic change these studies would benefit from paleontological data through expanded temporal scales identification of baselines and an understanding of how organisms have responded to past changes However resource management decisions rarely include input from paleontologists and paleoecological research is rarely incorporated into conservation decision making We seek to bridge this research implementation gap by highlighting the application of paleoecological data to issues such as biodiversity dynamics extinction risks and resilience to perturbations among other topics We hope to foster new cross disciplinary synergies by encouraging conservation scientists and managers to collaborate with paleontologists to

improve conservation decision making and by increasing awareness among paleontologists to the needs of the resource management community This Research Topic will provide a forum for both the paleontological and resource management communities to exchange ideas that will enhance restoration and conservation decision making We invite papers on conceptual advances reviews of specific topics to guide efforts in research or practice case studies of successful applications articles describing datasets with applied value and perspective papers summarizing a body of paleontological research with relevance to the resource management community Topics can include but are not limited to Responses of species communities and ecosystems to perturbations Strategies to achieve the direct integration of paleobiology and paleoecology into on ground resource management Identifying baselines and reference conditions Increasing the robustness of forecasting models through the incorporation of paleontological data Identifying key species interactions and other phenomena as indicators of impending change New methodologies analytical tools and or proxies in the application of paleontological data to conservation and restoration practice Lynn Wingard Damien Fordham and Greg Dietl have no conflicts of interest Chris Schneider has a potential conflict of interest where manuscripts pertain to stakeholders in the petroleum industry as she is an independent contractor in the Alberta Oil Sands mining area
