Abstract: This paper presents a synthesis of the design provisions of the second edition of the *Canadian Highway Bridge Design Code* (CHBDC) for fibre-reinforced structures. New design provisions for applications not covered by the first edition of the CHBDC and the rationale for those that remain unchanged from the first edition are given. Among the new design provisions are those for glass-fibre-reinforced polymer as both primary reinforcement and tendons in concrete; and for the rehabilitation of concrete and timber structures with externally bonded fibre-reinforced-polymer (FRP) systems or near-surface-mounted reinforcement. The provisions for fibre-reinforced concrete deck slabs in the first edition have been reorganized in the second edition to explicitly include deck slabs of both cast-in-place and precast construction and are now referred to as externally restrained deck slabs, whereas deck slabs containing internal FRP reinforcement are referred to as internally restrained deck slabs. Resistance factors in the second edition have been recast from those in the first edition and depend on the condition of use, with a further distinction made between factory- and field-produced FRP. In the second edition, the deformability requirements for FRP-reinforced and FRP-prestressed concrete beams and slabs of the first edition have been split into three subclauses covering the design for deformability, minimum flexural resistance, and crack-control reinforcement. The effect of sustained loads on the strength of FRPs is accounted for in the second edition by limits on stresses in FRP at the serviceability limit state.

Key words: beams, bridges, concrete, decks, fibre-reinforced-polymer reinforcement, fibre-reinforced-polymer sheets, prestressing, repair, strengthening, wood.

Résumé : Cet article présente une synthèse des dispositions de conception des structures renforcées de fibres telles énoncées dans la seconde édition du Code canadien sur le calcul des ponts routiers. Il aborde les nouvelles dispositions de conception pour les utilisations non couvertes dans la première édition et le raisonnement derrière les changements apportés. Parmi ces nouvelles dispositions se trouvent celles concernant les polymères renforcés de fibres de verre (= GFRP =) comme renforcement primaire et barres dans le béton ainsi que la réhabilitation des structures de béton et de bois d'œuvre au moyen de systèmes en polymère renforcé de fibres (= FRP =) externes ou de renforcement installé près de la surface (= NSMR =). Les dispositions concernant les dalles de tablier en béton renforcé de fibres (= FRC =) dans la première édition ont été réorganisées dans la seconde afin d'isoler explicitement les dalles de tablier des constructions coulées en place et précontraintes et ces dispositions sont maintenant regroupées sous les termes « dalles de tablier à encastrement externe » alors que les dalles de tablier contenant des renforcements « FRC » internes sont regroupées sous l'appellation « dalles de tablier à encastrement interne. » Les facteurs de résistance dans la seconde édition repris à partir de ceux de la première édition et dépendent de la condition d'utilisation; les « FRP » produits en

Modern Geotechnical Design Codes of Practice Patrick Arnold, Gordon A. Fenton, Michael A. Hicks, Timo Schweckendiek, Brian Simpson, 2013 The ground is one of the most highly variable of engineering materials It is therefore not surprising that geotechnical designs depend on local site conditions and local engineering experience Engineering practices relating to investigation and design methods site understanding and to safety levels acceptable to society will therefore vary between different regions The challenge in geotechnical engineering is to make use of worldwide geotechnical experience established over many years to aid in the development and harmonization of geotechnical design codes Given the significant uncertainties involved empiricism and engineering judgment will undoubtedly always be an essential element of geotechnical design However rigorous and scientific approaches based on probability theory are finding increased attention in the calibration of modern geotechnical codes of practice and these codes can and should be used to aid fundamental engineering

Bridge Evaluation, Repair and Rehabilitation A.S. Nowak,2012-12-06 Evaluation repair and rehabilitation of bridges

are increasingly important topics in the effort to deal with the deteriorating infrastructure For example in the United States about 40 percent of the nation s 570 000 bridges are classified according to the Federal Highway Administration s FHW A criteria as deficient and in need of rehabilitation and replacement In other countries the situation is similar FHW A estimates the cost of a bridge replacement and rehabilitation program at 50 billion dollars The major factors that have contributed to the present situation are the age inadequate maintenance increasing load spectra and environmental contamination The deficient bridges are posted repaired or replaced The disposition of bridges involves clear economical and safety implications To avoid high costs of replacement or repair the evaluation must accurately reveal the present load carrying capacity of the structure and predict loads and any further changes in the capacity deterioration in the applicable time span Accuracy of bridge evaluation can be improved by using the recent developments in bridge diagnostics structural tests material tests structural analysis and probabilistic methods There is a need for an international exchange of advanced experience to increase the research efficiency The Workshop is organized on the premise that the exchange of existing American and European experience in the area of bridge evaluation repair and rehabilitation is beneficial for both parties involved
