Dutt, 2005-12-06 It is widely acknowledged that the cost of validation and testing comprises a significant percentage of the overall development costs for electronic systems today and is expected to escalate sharply in the future Many studies have shown that up to 70% of the design development time and resources are spent on functional verification Functional errors manifest themselves very early in the design flow and unless they are detected up front they can result in severe consequence both financially and from a safety viewpoint Indeed several recent instances of high profile functional errors e.g the Pentium FDIV bug have resulted in increased attention paid to verifying the functional correctness of designs Recent efforts have proposed augmenting the traditional RTL simulation based validation methodology with formal techniques in an attempt to uncover hard to find corner cases with the goal of trying to reach RTL functional verification closure However what is often not highlighted is the fact that in spite of the tremendous time and effort put into such efforts at the RTL and lower levels of abstraction the complexity of contemporary embedded systems makes it difficult to guarantee functional correctness at the system level under all possible operational scenarios The problem is exacerbated in current System on Chip SOC design methodologies that employ Intellectual Property IP blocks composed of processor cores coprocessors and memory subsystems Functional verification becomes one of the major bottlenecks in the design of such systems **RF Circuit Design** Christopher Bowick, 2011-04-08 It's Back New chapters examples and insights all infused
