Many of the conventional constraints of clinical therapies have been replaced and overcome by the multifaceted applications of material science and nanotechnology. Recently material science based therapeutic agents are the major global pharmaceutical market and are believed to mount exponentially shortly. Among the various therapeutic agents hydrogels are one of the most widely applied materials used in the treatment of various diseases and one of the most diverse materials that are used for multipurpose applications. Hydrogels were the first biomaterials used for Human being. Hydrogels are polymeric linkages water insoluble however sometimes established as a colloidal gel in water. Hydrogels are the superabsorbent materials because it can absorb more than 90% water and hence regarded as natural living tissue. Mechanically strong hydrogels were synthesized by the advent of new synthetic strategies. Owing to the swollen properties three dimensional polymer network and strong mechanical characteristics these are widely used in catalysis adsorption drug delivery systems for proteins contact lenses wound
