Disturbance Analysis for Power Systems Mohamed A. Ibrahim, 2011-09-28 More than ninety case studies shed new light on power system phenomena and power system disturbances. Based on the author's four decades of experience, this book enables readers to implement systems in order to monitor and perform comprehensive analyses of power system disturbances. Most importantly, readers will discover the latest strategies and techniques needed to detect and resolve problems that could lead to blackouts to ensure the smooth operation and reliability of any power system. Logically organized, *Disturbance Analysis for Power Systems* begins with an introduction to the power system disturbance analysis function and its implementation. The book then guides readers through the causes and modes of clearing of phase and ground faults occurring within power systems as well as power system phenomena and their impact on relay system performance. The next series of chapters presents more than ninety actual case studies that demonstrate how protection systems have performed in detecting and isolating power system disturbances in Generators, Transformers, Overhead transmission lines, Cable transmission line feeders, Circuit breaker failures. Throughout these case studies, actual digital fault recording (DFR) records, oscillograms, and numerical relay fault records are presented and analyzed to demonstrate why power system disturbances happen and how the sequence of events are deduced. The final chapter of the book is dedicated to practice problems, encouraging readers to apply what they've learned to perform their own system disturbance analyses. This book makes it possible for engineers, technicians, and power system operators to perform expert power system disturbance analyses using the latest tested and proven methods. Moreover, the book's many cases studies and practice problems make it ideal for students studying power systems.

The Renaissance of Legacy Systems Ian Warren, 2012-12-06 Today software professionals recognize that change in software systems is inevitable. There are many systems currently in operation, however, which were developed before the need for change was understood. Such systems are commonly referred to as legacy systems and were developed with relatively short lifetimes in mind. Software engineering is a relatively young discipline which is

continually improving to provide better support for the development of software systems What were once state of the art techniques tools and processes are now dated and have resulted in systems which are not responsive to change For historical reasons dated development practice traded maintainability for other system attributes such as cost and performance A significant number of legacy systems remain in operation because they are critical to the business processes which they support The combination of extended lifetimes and poor maintainability means that legacy systems are expensive to change and in many cases they cannot accommodate emerging requirements This is clearly an undesirable situation which until recently has been tackled by replacing the system or attempting to maintain it Replacing a legacy system is dangerous since you face the risk of losing vital business knowledge which is embedded in many old systems In many cases system replacement is not cost effective Conversely if you attempt to maintain a legacy system there is often little return on the investment in maintenance effort and the system remains difficult and expensive to change

Domain-Specific Development of Event Condition Action Policies Raphael Romeikat,2014 IT systems have a high impact on organizations and businesses today and are a key to globalization Evolution of complexity calls for changes in the way these systems are built and managed As a consequence a paradigm shift towards Model Driven Engineering and Policy Based Management can be observed both aiming at a better management of complexity A lot of human effort is still necessary to develop and operate complex systems In this thesis an innovative approach to reduce that effort is presented Domain specific models are used to describe the IT system and its behavior at a high level of abstraction initially They are refined into technical representations at lower levels and finally transformed into event condition action policies These executable policies define which actions must or must not be performed to achieve the objectives of the system The refinement of models and the generation of policy implementations are both fully automated As high level changes are automatically materialized in the respective policies system behavior can be adapted at runtime simply by changing the high level models This allows to operate even complex systems without considering their technical details Finally the correctness of the refinement is proven with a relational algebra The benefits of the approach are demonstrated and evaluated with two real world case studies dealing with the management of mobile networks and the calculation of bonus payments
