New Research On Superconductivity New Research On Superconductivity:

New Research on Superconductivity Barry P. Martins, 2007 Superconductivity is the ability of certain materials to conduct electrical current with no resistance and extremely low losses High temperature superconductors such as $\text{La}_{2-x}\text{Sr}_x\text{CuO}_x$ Tc 40K and $\text{YBa}_2\text{Cu}_3\text{O}_{7-x}$ Tc 90K were discovered in 1987 and have been actively studied since In spite of an intense world wide research effort during this time a complete understanding of the copper oxide cuprate materials is still lacking Many fundamental questions are unanswered particularly the mechanism by which high Tc superconductivity occurs More broadly the cuprates are in a class of solids with strong electron electron interactions An understanding of such strongly correlated solids is perhaps the major unsolved problem of condensed matter physics with over ten thousand researchers working on this topic High Tc superconductors also have significant potential for applications in technologies ranging from electric power generation and transmission to digital electronics This ability to carry large amounts of current can be applied to electric power devices such as motors and generators and to electricity transmission in power lines For example superconductors can carry as much as 100 times the amount of electricity of ordinary copper or aluminium wires of the same size Many universities research institutes and companies are working to develop high Tc superconductivity applications and considerable progress has been made This volume brings together new leading edge research in the field

The Physics of Superconductors Karl-Heinz Bennemann, John B. Ketterson, 2012-12-06 Superconductivity has undergone tremendous advances in recent years Most notable of course was the discovery of high temperature superconductivity in the cuprates This discovery resulted in an enormous influx of new workers to the field representing a host of experimental and theoretical disciplines When we combine this with the discovery of superconductivity in other materials such as heavy fermion metals MgB_2 various organics fullerenes field effect devices magnetic metals under pressure and presumably non s symmetry triplet Cooper pairing in ruthenates e g Sr_2RuO_4 we have an enrichment of the phenomena superconductivity This resulted in an explosion of interest in the field Many of the new superconductors are being called unconventional either with respect to the pairing mechanism or the symmetry of the under lying order parameter Yet in spite of these new materials and directions continuing studies of conventional electron phonon based superconductivity remain interesting With the aid of historical hindsight we expect the field to continue to advance in unexpected directions Nonetheless it is our view that a state of the art treatise on superconductivity is justified at this time not only to summarize the present understanding but also to introduce newcomers to the field as was the case with the two justly famous 1968 bibles of super conductivity by our former colleague R D Parks for an earlier generation Hopefully the present books might help to point the way for future workers research and discoveries

Rare Earth Transition Metal Borocarbides (Nitrides) Karl-Hartmut Müller,Vladimir Narozhnyi,2012-12-06 This volume contains most of the contributions presented at the NATO Advanced Research Workshop on Rare Earth Transition Metal Borocarbides Nitrides Superconducting Magnetic and Normal State Properties held in Dresden Germany at 13 18 June 2000 The Workshop was chaired by K H Müller and V N Narozhnyi This was the first meeting specially focused on the quaternary rare earth transition metal borocarbides and nitrides a new class of magnetic superconductors discovered in 1994 The motivation for organizing this workshop was to bring together scientists both experimentalists and theoreticians actively working in this field in different countries using different methods to exchange their points of view on the properties of these materials and to recognize the directions for future research Totally 48

participants from 17 countries of Europe the United States Brazil India Israel and Japan took part in this meeting In addition about 15 observers mainly from Germany attended The scientific Programme of the Workshop was composed of 7 sections The section Introduction and Overview was followed by the Electronic Structure and Properties and Phonon Spectra Magnetic Properties and CEF Effects Interplay between Superconductivity and Magnetism Vortex Lattice Thin Films Nature of the Superconducting State in Borocarbides sections Totally 50 presentations were given 45 of them in oral form Considerable attention was devoted to the characterization of the particular place of borocarbides amongst the other magnetic and superconducting systems and especially magnetic superconductors

A New Direction in Mathematics for Materials Science Susumu Ikeda, Motoko Kotani, 2015-12-08 This book is the first volume of the SpringerBriefs in the Mathematics of Materials and provides a comprehensive guide to the interaction of mathematics with materials science The anterior part of the book describes a selected history of materials science as well as the interaction between mathematics and materials in history The emergence of materials science was itself a result of an interdisciplinary movement in the 1950s and 1960s Materials science was formed by the integration of metallurgy polymer science ceramics solid state physics and related disciplines We believe that such historical background helps readers to understand the importance of interdisciplinary interaction such as mathematics materials science collaboration The middle part of the book describes mathematical ideas and methods that can be applied to materials problems and introduces some examples of specific studies for example computational homology applied to structural analysis of glassy materials stochastic models for the formation process of materials new geometric measures for finite carbon nanotube molecules mathematical technique predicting a molecular magnet and network analysis of nanoporous materials The details of these works will be shown in the subsequent volumes of this SpringerBriefs in the Mathematics of Materials series by the individual authors The posterior section of the book presents how breakthroughs based on mathematics materials science collaborations can emerge The authors argument is supported by the experiences at the Advanced Institute for Materials Research AIMR where many researchers from various fields gathered and tackled interdisciplinary research
