The Proteasome in Neurodegeneration Leonidas Stefanis, J. N. Keller, 2007-08-02 In the last 50 years a wealth of information has allowed us to understand the contribution of various regulatory factors that alter mRNA and protein synthesis to a variety of physiological and pathological conditions However such regulation is only one of many factors that contribute to the levels of a given protein One major factor that has been relatively obscure until recently has been the contribution of protein degradation to the regulation of the steady state level of protein expression and protein function This rapidly evolving field has made a significant mark on the scientific community as highlighted by the Award of the Nobel Prize in Chemistry for 2004 to Aaron Ciechanover Avram Hershko and Irwin Rose for their pioneering work on the ubiquitin proteasome system UPS of protein degradation which is the subject of this volume In recent years evidence has been accumulating that suggests a role for UPS function in both physiological and pathological settings In particular studies have implicated a central role for the UPS in cell cycle regulation cancer and neurodegeneration Two points are however worth bearing in mind First ubiquitin function appears to extend far beyond the UPS and protein degradation second there are other important systems of intracellular protein degradation most notably autophagic systems through the lysosomes and these may also be involved in disease pathophysiology

New Prognostic and Predictive Markers in Cancer Progression Susan Costantini, Alfredo Budillon, Alfredo Budillon, 2021-02-12

Biomarkers are of critical medical importance for oncologists allowing them to predict and detect disease and to determine the best course of action for cancer patient care Prognostic markers are used to evaluate a patient's outcome and cancer recurrence probability after initial interventions such as surgery or drug treatments and hence to select follow up and further treatment strategies On the other hand predictive markers are increasingly being used to evaluate the probability of benefit from clinical intervention's driving personalized medicine Evolving technologies and the increasing availability of multiomics data are leading to the selection of numerous potential biomarkers based on DNA RNA miRNA protein and metabolic alterations within cancer cells or tumor microenvironment that may be combined with clinical and pathological data to greatly improve the prediction of both cancer progression and therapeutic treatment responses However in recent years few biomarkers have progressed from discovery to become validated tools to be used in clinical practice This Special Issue comprises eight review articles and five original studies on novel potential prognostic and predictive markers for different cancer types
