**Abstract**—The effect of neopron GM, guanethidine on selectively noradrenergic-denervated rat cerebral cortex was investigated by examining the spatial distribution of endogenous noradrenergic brain and by fluorescence histochemical analysis. A local noradrenergic denervation was produced by neopron GM infusion of the selective noradrenergic reuptake 6-hydroxydopamine for 3 or 7 days. The neopron GM infusion caused an almost complete noradrenergic denervation in a restricted area around the infusion point as reflected by an almost complete long-term disappearance of noradrenaline nerve terminals and reduction of noradrenaline levels. There was with time a slow recovery of the levels, most likely related to a spontaneous noradrenergic nerve terminal regeneration. Post-treatment for 1 week with GM, had very small effects on the 6-hydroxydopamine-induced reduction of the noradrenergic levels, while pre-treatment with GM, for 3 days before the toxicogenic infusion and continuing the GM, administration for another 7-10 days, significantly enhanced noradrenergic recovery, as observed both bio- and histochemically. GM, had no effect on the 6-hydroxydopamine-induced noradrenergic depletion events, indicating that GM, does not interfere with the drug reuptake action of 6-hydroxydopamine.

The present results thus indicate that neopron GM, enhances recovery of noradrenergic nerve terminals, which may be due to a regenerative effect (regeneration-promoting) and/or related to preventive action of GM, against retrograde degeneration of noradrenergic axons following the neurotoxin-induced lesion.

Although a great deal of research has been conducted over the years to elucidate the molecular signals governing structural regeneration and functional recovery after neuronal damage, the knowledge about these processes is still fragmentary and incomplete. It is therefore of great interest, both from a theoretical and clinical point of view, that there is an increasing body of evidence suggesting that exogenous administration of guanethidine can stimulate regrowth processes and functional recovery after lesions of nervous system both in the C.Fish and W.Fish.<sup>1-3,11,12,15,16,17</sup> Very little is at present known about the mode of action of guanethidine in promoting neuronal regrowth phenomena, although it is conceivable that this may be facilitating or potentiating the effect of endogenous neurotrophic or growth-promoting factors. Guanethidines, which are particularly abundant in neuronal plasma membranes,<sup>18</sup> have been implicated as receptors for various bioactive compounds, but the data so far available suggest that they are not receptors for endogenous neurotrophic factors.<sup>11-12</sup> The present study was undertaken to investigate whether or not the neurotoxicoprogrowth GM, can affect regeneration of noradrenaline (NA)

nerve terminals innervating the cerebral cortex after a selective NA denervation induced by the local administration of the neurotoxic 6-hydroxydopamine (6-OH-DOPA).

### EXPERIMENTAL PROCEDURES

**Male albino rats** (Sprague-Dawley) weighing about 100 g at the start of each experiment were used. After surgical preparation, the animals were housed in individual cages during the infusion period. They were kept in a room with controlled temperature, humidity and dark-light schedule (12h/12h) and received food and water *ad libitum*. For experiments GM, (Sigma Co, St. Louis, Mo) was dissolved in 0.9% NaCl and infused in a volume of 0.5 ml. 6-OH-DOPA acted as a partial infuser of the infuser. Guanethidines were prepared by repeated removal of the superior cervical ganglion under ether anaesthesia 3 days prior to the start of the experiment.

### 6-Hydroxydopamine infusion

The neurotoxicity method introduced by Bjoerklund et al.<sup>19,20</sup> for local NA denervation in the visual cortex of kitten was adopted for the rat. The animals were anaesthetized (ketofen pentobarbital, 50 mg/kg i.p.) and the skull bone exposed by a craniotomy of the skin on the vertex. A hole 1.5 mm was drilled on the right side 1.5 mm lateral of the midline and 1 mm posterior to the bregma and a stainless-steel cannula (10 gauge hypodermic needle) was implanted under stereotaxic coordinates dorsally into cortical layer I (1.5 mm deep into the grey matter of parietal cortex). The cannula was fixed to the skull with dental cement and connected to an osmotic minipump (Alza 2001) reservoir (c. 1 µl/h) with polyethylene tubing. After filling of the cannula with 1 mM 6-OH-DOPA, 10% GM (Sigma) dissolved

several isoform specific biochemically distinct properties Since 3A peptide binds apoE in the lipoprotein binding domain of the protein and not in the receptor binding domain apoE could target bound 3A4 peptide to neurons via the LRP receptor Internalization of the apoE/3A peptide complex into the cell by the same route as the apoE containing lipoproteins would result in incorporation into primary lysosomes and pH dependent dissociation The demonstration of apoE in the cytoplasm of neurons with isoform specific interactions of apoE with the microtubule binding protein tau demonstrated in vitro suggest additional testable hypotheses of disease pathogenesis
