[Central Nervous System Metastases in Lung Cancer Patients: From Prevention to Diagnosis and Treatment](#) Lizza E.L Hendriks,Deepa S. Subramaniam,Anne-Marie C. Dingemans,2019-01-21

Approximately 40% of lung cancer patients will develop central nervous system CNS metastases during the course of their disease Most of these are brain metastases but up to 10% will develop leptomeningeal metastases Known risk factors for CNS metastases development are small cell lung cancer SCLC adenocarcinoma histology epidermal growth factor receptor EGFR mutant or anaplastic lymphoma kinase ALK rearranged lung cancer advanced nodal status tumor stage and younger age CNS metastases can have a negative impact on quality of life QoL and overall survival OS The proportion of lung cancer patients diagnosed with CNS metastases has increased over the years due to increased use of brain imaging as part of initial cancer staging advances in imaging techniques and better systemic disease control Post contrast

gadolinium enhanced magnetic resonance imaging gd MRI is preferred however when this is contra indicated a contrast enhanced computed tomography CE CT is mentioned as an alternative option When CNS metastases are diagnosed local treatment options consist of radiotherapy stereotactic or whole brain and surgery Local treatment can be complicated by symptomatic radiation necrosis for which no high level evidence based treatment exists Moreover differential diagnosis with metastasis progression is difficult Systemic treatment options have expanded over the last years Until recently chemotherapy was the only treatment option with a poor penetration in the CNS Angiogenesis inhibitors are promising in the treatment of primary CNS tumors as well as radiation necrosis but clinical trials of anti angiogenic agents in NSCLC have largely excluded patients with CNS metastases Furthermore research has also focused on methods to prevent development of CNS disease for example with prophylactic cranial irradiation Recently checkpoint inhibitors have become available for NSCLC patients and tyrosine kinase inhibitors TKIs have improved prognosis significantly in those with a druggable driver mutation Newer TKIs are often designed to have better CNS penetration compared to first generation TKIs Despite advances in treatment options CNS metastases remain a problem in lung cancer and cause morbidity and mortality This Research Topic provides an extensive resource of articles describing advances in CNS metastases management in lung cancer patients from prevention to diagnosis and treatment

**Investigating the Interplay Between Tumor Mutations, Immune Evasion, and Targeted Therapy Resistance** Shanye Yin,Guangchuang Yu,Yinghao Wu,2025-04-29 The field of cancer research has been significantly focused on understanding the complex interplay between tumor mutations immune evasion and resistance to targeted therapies Tumors are known to harbor a multitude of genetic alterations that not only drive their initiation growth and progression but also provide them with a selective advantage leading to immune evasion and therapy resistance The tumor microenvironment further complicates this interaction by influencing the relationship between tumor cells and the immune system thereby affecting treatment outcomes Despite the current understanding of these processes

there are still gaps in knowledge particularly in understanding how specific tumor mutations contribute to immune evasion and therapy resistance The primary aim of this research topic is to delve deeper into the intricate relationship between tumor mutations immune evasion and targeted therapy resistance The goal is to understand how oncogenic mutations result in the production of neoantigens that can elicit an immune response and how tumor cells have evolved mechanisms to evade this immune surveillance This includes the downregulation of antigen presentation machinery upregulation of immune checkpoint molecules and recruitment of immunosuppressive cells Furthermore the research aims to investigate how these immune evasion mechanisms confer resistance to targeted therapies which have revolutionized cancer treatment by selectively inhibiting key signaling pathways driving tumor growth
