steam iron and steel required new rules and new ways of thinking for the design and building of ships In the 1800s
shipbuilding moved from sail and wood to steam iron and steel The competitive pressure to achieve more predictable ocean
transportation drove the industrialization of shipbuilding as shipowners demanded ships that enabled tighter scheduling
improved performance and safe delivery of cargoes In *Bridging the Seas* naval historian Larrie Ferreiro describes this
transformation of shipbuilding portraying the rise of a professionalized naval architecture as an integral part of the Industrial
Age Picking up where his earlier book *Ships and Science* left off Ferreiro explains that the introduction of steam iron and
steel required new rules and new ways of thinking for designing and building ships The characteristics of performance had to
be first measured then theorized Ship theory led to the development of quantifiable standards that would ensure the safety
and quality required by industry and governments and this in turn led to the professionalization of naval architecture as an
engineering discipline Ferreiro describes among other things the technologies that allowed greater predictability in ship
performance theoretical developments in naval architecture regarding motion speed and power propellers maneuvering and
structural design the integration of theory into ship design and construction and the emergence of a laboratory infrastructure
