**Bigger than Chaos** Michael Strevens, 2009-06-30 Many complex systems from immensely complicated ecosystems to minute assemblages of molecules surprise us with their simple behavior. Consider for instance the snowflake in which a great number of water molecules arrange themselves in patterns with six way symmetry. How is it that molecules moving seemingly at random become organized according to the simple six fold rule? How do the comings goings meetings and eatings of individual animals add up to the simple dynamics of ecosystem populations? More generally how does complex and seemingly capricious microbehavior generate stable predictable macrobehavior? In this book Michael Strevens aims to explain how simplicity can coexist with indeed be caused by the tangled interconnections between a complex system's many parts. At the center of Strevens's explanation is the notion of probability and more particularly probabilistic independence. By examining the foundations of statistical reasoning about complex systems such as gases ecosystems and certain social systems Strevens provides an understanding of how simplicity emerges from complexity. Along the way he draws lessons concerning the low level explanation of high level phenomena and the basis for introducing probabilistic concepts into physical theory.

**Complexity and Spatial Networks** Aura Reggiani, Peter Nijkamp, 2009-08-14 Complex systems analysis has become a fascinating topic in modern research on non linear dynamics not only in the physical sciences but also in the life sciences and the social sciences. After the era of bifurcation theory chaos theory syn getics

resilience analysis network dynamics and evolutionary thinking currently we observe an increasing interest in critical transitions of dynamic real world systems in many disciplines such as demography biology psychology economics earth sciences geology seismology medical sciences and so on The relevance of this approach is clearly reflected in such phenomena as traffic congestion financial crisis ethnic conflicts eco system breakdown health failures etc This has prompted a world wide interest in complex systems Geographical space is one of the playgrounds for complex dynamics as is witnessed by population movements transport flows retail developments urban expansion lowland flooding and so forth All such dynamic phenomena have one feature in common the low predictability of uncertain interrelated events occurring at different interconnected spatio temporal scale levels and often originating from different disciplinary backgrounds The study of the associated non linear fast and slow dynamic transition paths calls for a joint research effort of scientists from different disciplines in order to understand the nature the roots and the consequences of unexpected or unpredictable changes in complex spatial systems
