Binary Decision Diagrams and Extensions for System Reliability Analysis Liudong Xing, Suprasad V. Amari, 2015-06-05 Recent advances in science and technology have made modern computing and engineering systems more powerful and sophisticated than ever. The increasing complexity and scale imply that system reliability problems not only continue to be a challenge but also require more efficient models and solutions. This is the first book systematically covering the state of the art binary decision diagrams and their extended models which can provide efficient and exact solutions to reliability analysis of large and complex systems. The book provides both basic concepts and detailed algorithms for modelling and evaluating reliability of a wide range of complex systems such as multi state systems, phased mission systems, fault tolerant systems with imperfect fault coverage, systems with common cause failures, systems with disjoint failures, and systems with functional dependent failures. These types of systems abound in safety critical or mission critical applications such as aerospace circuits, power systems, medical systems, telecommunication systems, transmission systems, traffic light systems, data storage systems, and etc. The book provides both small scale illustrative examples and large scale benchmark examples to demonstrate broad applications and advantages of different decision diagrams based methods for complex system reliability analysis. Other measures including component importance and failure frequency are also covered. A rich set of references is cited in the book providing helpful resources for readers to pursue further research and study of the topics. The target audience of the book is reliability and safety engineers or researchers. The book can serve as a textbook on system reliability analysis. It can also serve as a tutorial and reference book on decision diagrams, multi state systems, phased mission systems, and imperfect fault coverage models.

Geodynamics of the Indian Plate Neal Gupta, Sampat K. Tandon, 2020-02-28 This book provides insights on new geological tectonic and climatic developments in India through a time progression from the Archean to the Anthropocene that are captured via authoritative entries from experts in earth sciences. This volume aims to bring graduate students and researchers up to date on the geodynamic evolution of the Indian Plate, concepts that have so far resulted in a rather uneven treatment of the subject at different institutions. The book is divided into 4 sections and includes perspectives such as the formation and evolution of the Indian crust in comparison to its neighbors such as Antarctica, Africa, and Australia; the evolution of Precambrian cratons and sedimentary basins of India; and a summary account of early life reported in the

processes Non staple crops are often climate resilient and grown in marginal regions with low input conditions including examples for tolerance of drought stress in cowpea and buckwheat tolerance of heat in cassava and tolerance of barren in sweetpotato Investigating the mechanism of their environmental adaptability would provide new insights for breeding of not only non staple crops but also staple crops that are limited in the tolerance of a changing climate to ensure future food security It is of great theoretical significance and practical application value to study the molecular regulatory network of non staple crops under these stress conditions Using cultivation measures plant growth regulators fertilizers and other methods to improve the environmental stress resistance and important agronomic traits in non staple crops Revealing molecular mechanisms and regulatory network under all kinds of environmental stresses in non major crops and improving stress tolerance through genetic engineering Identifying key regulatory genes of important agronomic traits in non staple crops and improving molecular breeding methods
