MapReduce Design Patterns Donald Miner, Adam Shook, 2012-11-21 Until now design patterns for the MapReduce framework have been scattered among various research papers, blogs, and books. This handy guide brings together a unique collection of valuable MapReduce patterns that will save you time and effort regardless of the domain language or development framework you're using. Each pattern is explained in context with pitfalls and caveats clearly identified to help you avoid common design mistakes when modeling your big data architecture. This book also provides a complete overview of MapReduce that explains its origins and implementations and why design patterns are so important. All code examples are written for Hadoop. Summarization patterns get a top-level view by summarizing and grouping data. Filtering patterns view data subsets such as records generated from one user. Data organization patterns reorganize data to work with other systems or to make MapReduce analysis easier. Join patterns analyze different datasets together to discover interesting relationships. Metapatterns piece together several patterns to solve multi-stage problems or to perform several analytics in the same job. Input and output patterns customize the way you use Hadoop to load or store data. A clear exposition of MapReduce programs for common data processing patterns. This book is indispensable for anyone using Hadoop. Tom White, author of Hadoop: The Definitive Guide.

Novel 3D Media Technologies Ahmet Kondoz, Tasos Dagiuklas, 2014-11-14 This book describes recent innovations in 3D media and technologies with coverage of 3D media capturing, processing, encoding, and adaptation, networking aspects for 3D Media, and quality of user experience (QoE). The contributions are based on the results of the FP7 European Project ROMEO, which focuses on new methods for the compression and delivery of 3D multi-view video and spatial audio, as well as the optimization of networking and compression jointly across the future Internet. The delivery of 3D media to individual users remains a highly challenging problem due to the large amount of data involved, diverse network characteristics, and user terminal requirements, as well as the user's context such as their preferences and location. As the number of visual views increases, current systems will struggle to meet the demanding requirements in terms of delivery of consistent video quality to fixed and mobile users. ROMEO will present hybrid networking solutions that combine the DVB-T2 and DVB-NGH broadcast access network technologies together with a QoE-aware Peer-to-Peer (P2P) distribution system that operates over wired and wireless links. Live streaming 3D media needs to be received by collaborating users at the same time or with imperceptible delay to enable them to watch together while exchanging comments as if they were all in the same location. This book is the second of a series of three annual volumes devoted to the latest results of the FP7 European Project ROMEO. The present volume provides state-of-the-art information on immersive media, 3D multi-view video, spatial audio, cloud-based media networking protocols for 3D media, P2P 3D media streaming, and 3D Media delivery across heterogeneous wireless networks, among other topics. Graduate students and professionals in electrical engineering and computer science with an interest in 3D Future Internet Media will find this volume to be essential reading. Describes the latest innovations in
