Grid Economics and Business Models Dirk Neumann, Thomas Fahringer, 2008-08-21 The Grid computing concept, which allows users to integrate administratively and geographically dispersed computing resources, has been gaining traction in a number of application areas during the past few years. By interconnecting many heterogeneous, though usually virtualized, computing resources, virtual computer centers or supercomputers can be created, providing a seamless supply of computing resources. Grid computing provides benefits not only for scientific computing (e.g., SETI@home, which interconnects one million computers across 226 countries with a total processing power of 711 TFLOPS), but also in a commercial environment. It is projected that computing Grids can lower the total IT costs of businesses by 30%. The report *Grid Computing: A Vertical Market Perspective 2005-2010* by The Insight Research Corporation estimates an increase of worldwide Grid spending from 714.9 million in 2005 to approximately 19.2 billion in 2010. One of the most prominent activities in academia is the EGEE project, being funded with 30 MEuro by the European Commission. EGEE brings together researchers from over 27 countries with the common aim of developing a service Grid infrastructure, which is suited for scientific computing with very high demand for processing power.

Grid Economics and Business Models Daniel J. Veit, 2007-08-28 This volume constitutes the refereed proceedings of the 4th International Workshop on Grid Economics and Business Models, held in August 2007. The twelve full papers are organized into topical sections covering grid business, modeling, market mechanisms for the grid, and economic grid service provisioning. The proceedings are rounded off by six project reports that give an overview of current and ongoing research in grid economics.

Distributed Economic Operation in Smart Grid: Model-Based and Model-Free Perspectives Jiahui Qin, Yanni Wan, Fangyuan Li, Yu Kang, Weiming Fu, 2023-01-25 This book aims to work out the distributed economic operation in smart grids in a systematic way, which ranges from model-based to model-free perspectives. The main contributions of this book can be summarized into three folds. First, we investigate the fundamental economic operation problems in smart grids from a model-based perspective. Specifically, these problems can be modeled as deterministic optimization models, and we propose some distributed optimization algorithms by integrating the multi-agent consensus theory and optimization techniques to achieve the distributed coordination of various generation units.

and loads Second due to the randomness of the large scale renewable energies and the flexibility of the loads we further address these economic operation problems from a model free perspective and we propose learning based approaches to address the uncertainty and randomness At last we extend the idea of model based and model free algorithms to plug in electric vehicles PEVs charging discharging scheduling problem the key challenge of which involves multiple objectives simultaneously while the behavior of PEVs and the electricity price are intrinsically random This book presents several recent theoretical findings on distributed economic operation in smart grids from model based and model free perspectives By systematically integrating novel ideas fresh insights and rigorous results this book provides a base for further theoretical research on distributed economic operation in smart grids It can be a reference for graduates and researchers to study the operation and management in smart grids Some prerequisites for reading this book include optimization theory matrix theory game theory reinforcement learning etc *Smart Grids* Stuart Borlase,2017

Next Generation Smart Grids: Modeling, Control and Optimization Surender Reddy Salkuti,Papia Ray,2022-03-10 This book is a collection of chapters describing the advanced and future aspects of smart grid technology The book emphasizes technical issues theoretical background and practical applications that drive postgraduates researchers and practicing engineers with the right advanced skills vision and knowledge who will further be capable of leading in teams involved in the modelling control design and optimization of the future smart grids This feature strengthens the benefits of the book for the readers who will gain an insightful understanding of future smart grid challenges including i the formulation of decision making models ii the familiarization with efficient solution algorithms for such models and iii insights into these problems through the detailed analysis of numerous illustrative examples Further the chapters in this book provide comprehensive coverage of modelling control and optimization of smart grid which are quite different from most technical publications

Modeling and Optimization of the Smart Grid Ecosystem Iordanis Koutsopoulos,Thanasios G. Papaioannou,Vasiliki Hatzi,2016 The smart energy grid has evolved into a complex ecosystem with new entering actors such as aggregators and traditional ones like consumers operators and generators having fundamentally different active roles in the system In addition advances in key technologies such as renewables energy storage communication and control have paved the way to new research directions and problems In this work we attempt to give some structure to the complex ecosystem above and we present key research problems that shape the area The emphasis is on the control and optimization methodology toward approaching these problems The first thread we consider is demand response where the central theme is to optimize the demand load of consumers The basic problem is the scheduling of demand load of consumers with the aim to minimize a cost function from the point of view of the utility operator or the consumer Next we review fundamental problems in energy storage management The basic energy storage management problem amounts to deciding when and how much to charge and discharge the battery in order to achieve a certain optimization objective either in terms of a generation cost or a mismatch

between energy demand and supply which again may capture the goals of the consumer or the utility We also discuss the market interactions of various entities in the smart grid ecosystem and the impact of their strategic decisions on the market structure Finally we study key aspects of consumer behavior such as response to gamification models and uncertainty due to consumer decisions that influence the system and we discuss the role of data in building data driven models for predicting consumer behavior For each problem instance above we provide an exposition that places emphasis on the related model and on key aspects of the analysis
