

intricate in mid-nineteenth-century Britain, a circumstance that resulted in a period of intense intellectual curiosity for professionals and amateurs alike. Artists benefited from scientific discovery as much as scientists profited from aesthetic vision—though it should be noted that the notion of “the artist” was probably not as fixed as it is today. All in all, as Kathryn A. Tuma’s essay extensively describes, the empirical approach to nature, together with the use of optical devices and advances in chemistry’s understanding of new materials and processes, began to influence art through those scientific disciplines concerned with the analysis and description of the phenomenal world. For the artist shared common fields of interest and similar materials of study with the botanist, geologist, and others, however different their purposes. The recording and collecting of evidence—its *rendering*—was an essential condition for scientific progress, while artistic development and modes of perception became increasingly inspired by empirical habits of observation.²

In the productive interaction between art and science in the nineteenth century, drawing played a key role, and, as a device for thinking and recording, it was soon itself to become the subject of scrutiny and exploration—of deterritorialization and reterritorialization, or to speak. The area in which this experimentation was keenest seems to have been botanical illustration, as it exemplified not only a respect in which art at the time began to take over from science, but also the intimate reciprocity between plants and humans. Centering on material from England and Scotland, “Ocean Flowers” draws attention to different forms of natural-history illustration from the mid-1800s, since never before in this field had such fundamental changes occurred in such a short time. The experimental impulse of the image is reflected in the use of such diverse graphic media as drawings,³ watercolored prints,⁴ nature prints (botanographs or direct imprints from plants), natural illustrations (dried specimens or *exsiccati* of actual plants mounted and collaged on the sheet),⁵ as well as and “photogenic drawings,”⁶ as William Henry Fox Talbot first dubbed his early, eponymous photographs in 1839. Although in a book it can be difficult to distinguish these techniques from one another (the process of printing entails a certain flattening of images and loss of surface detail), the aim of this publication is nevertheless to attempt to convey a sense of the diversity among and the contention between, or rather collaboration among, media in Victorian botanical illustration as they connected to a larger picture of exploration and adventure, both aesthetic and geopolitical. Rather than giving a survey of the development of graphics throughout history, the
