**Composite Materials** Lauge Fuglsang Nielsen,2005-11-02 In the past ve decades considerable attention has been devoted to comp ite materials A number of expressions have been suggested by which mac scopic properties can be

predicted when the properties geometry and volume concentrations of the constituent components are known Many expressions are purely empirical or semi theoretical Others however are theoretically well founded such as the exact results from the following classical boundary studies Bounds for the elastic moduli of composites made of perfectly coherent homogeneous isotropic linear elastic phases have been developed by Paul <sup>1</sup> and Hansen <sup>2</sup> for unrestricted phase geometry and by Hashin and Shtrikman <sup>3</sup> for phase geometries which cause macroscopic homogeneity and isotropy The composites dealt with in this book are of the latter type For two specific situations later referred to Hashin <sup>4</sup> and Hill <sup>5</sup> derived exact solutions for the bulk modulus of such materials Hashin considered the so called Composite Spheres Assemblage CSA consisting of tightly packed congruent composite elements made of spherical particles embedded in concentric trix shells Hill considered materials in which both phases have identical shear moduli In the field of predicting the elastic moduli of homogeneous isotropic composite materials in general the exact Hashin and Hill solutions are of theoretical interest mainly Only a few real composites have the geometry defined by Hashin or the stress distribution assumed by Hill The enormous significance however of the Hashin Hill solutions is that they represent bounds which must not be violated by stress predicted by any new theory claiming to consider geometries in general
